

Multiple Indicator Cluster Survey

Ukraine 2025-26

Survey Findings Report

State Statistics Service of Ukraine

October 2026

The 2025-26 Ukraine Multiple Indicator Cluster Survey (MICS) was carried out in 2025-2026 by the Ukrainian Center for Social Reforms (UCSR) under the national ownership and coordination of the State Statistics Service of Ukraine (SSSU), as part of the Global MICS Programme. Technical support was provided by the United Nations Children's Fund (UNICEF), with financial support of UNICEF and the Government of Germany through KfW Bank.

The Global MICS Programme was developed by UNICEF in the 1990s as an international multi-purpose household survey programme to support countries in collecting internationally comparable data on a wide range of indicators on the situation of children and women. MICS surveys measure key indicators that allow countries to generate data for use in policies, programmes, and national development plans, and to monitor progress towards the Sustainable Development Goals (SDGs) and other internationally agreed upon commitments. The 2025-26 Ukraine MICS aims to fill critical data gaps since the previous survey in 2012 and provide nationally representative evidence on the situation of children, women and households during the full-scale war. Its findings will support SDG and child-rights monitoring, recovery and development planning, and the design of more equitable policies and programmes, including through disaggregated data on vulnerable and disadvantaged population groups.

The objective of this report is to facilitate the timely dissemination and use of results from the 2025-26 Ukraine MICS. The report contains detailed information on the survey methodology, and all standard MICS tables. The report is accompanied by a series of Statistical Snapshots of the main findings of the survey.

For more information on the Global MICS Programme, please go to **mics.unicef.org**.

Summary table of survey implementation and the survey population

Survey sample and implementation

Sample frame	A multi-source population estimation model built using the most up-to-date demographic, administrative, and geospatial data available at the time of sample design creation for 2024–2025, with subsequent disaggregation to the level of settlements and voting areas. (March 2025)	**Questionnaires**	Household Women age 15-49 Children under five Children age 5-17
Interviewer training	August 2025	**Fieldwork**	October 2025 – March 2026
Refresher trainings	October-November 2025		

Survey sample

Households		**Women age 15-49**	
• Sampled • Occupied • Interviewed • Response rate (Per cent)	23,708 21,891 16,186 73.9	• Eligible for interviews • Interviewed • Response rate (Per cent)	8,213 7,033 85.6
Water Quality Testing Form		**Children under five**	

• Sampled[1]
• Occupied
• Response rate (Per cent)
  • Household
  • Source
  • Source water laboratory test
	4,940
	4,575
	
	51.1
	47.3
	11.7
		• Eligible
		• Mothers/caretakers interviewed
		• Response rate (Per cent)
			3,317
			3,067
			92.5

		Children age 5-17	
		• Number in interviewed households • Eligible[2] • Mothers/caretakers interviewed • Response rate (Per cent)	5,546 3,887 3,626 93.3

Survey population

Average household size	2.0	**Percentage of population living in**	
Percentage of population under:		• Urban areas • Rural areas	61.1 38.9
Age 5 Age 18	3.5 16.1	• High degree of urbanisation • Moderate degree of urbanisation • Low degree of urbanisation	35.3 34.1 30.6
Percentage of women age 15-49 years with at least one live birth in the last 2 years	5.1	• North macroregion • West macroregion • Center macroregion • East macroregion • South macroregion	25.9 29.6 15.2 19.3 9.9

[1] The Water Quality Testing Form was administered to 5 randomly selected households in each cluster.

[2] The Questionnaire for Children and Adolescents Age 5-17 was administered to one randomly selected child in each interviewed household.

Acknowledgements

The Ukraine Multiple Indicator Cluster Survey 2025-26 was implemented by the State Statistics Service of Ukraine in cooperation with UNICEF. Technical support was provided by the UNICEF Ukraine Country Office, the UNICEF Regional Office for Europe and Central Asia, and the Global MICS Programme at UNICEF Headquarters.

The Ukrainian Center for Social Reforms supported the organization and implementation of fieldwork, including the recruitment, training, supervision and coordination of survey teams. M.V. Ptukha Institute for Demography and Life Quality Studies of the National Academy of Sciences of Ukraine contributed to the methodological preparation, analysis and interpretation of the survey findings.

The survey benefited from the guidance and contributions of the MICS Steering Committee and Technical Committee, as well as relevant ministries, government institutions and technical partners. Particular appreciation is extended to the Ministry of Education and Science of Ukraine and the Institute of Educational Analytics for their cooperation on the education-related components of the survey, and to the Ministry of Health of Ukraine, the Public Health Centre and the regional Centres for Disease Control and Prevention for their support to the water quality testing component.

Financial support for the survey was provided by the German Government through KfW Development Bank, UNICEF global resources, and the UNICEF Ukraine Country Programme Document thematic pool.

Special appreciation is extended to the survey coordinators, questionnaire and data-processing teams, trainers, fieldwork supervisors, interviewers, measurers, and administrative personnel whose dedication and professionalism made the survey possible under exceptionally challenging circumstances.

Finally, sincere gratitude is expressed to all households, women, parents, caregivers, and children who participated in the survey and shared their time and experiences. Their contribution has made it possible to generate essential evidence for improving policies and programmes for children, women and families in Ukraine.

1. Introduction

This report presents the findings of the 2025-26 Ukraine Multiple Indicator Cluster Survey, implemented under the national ownership and coordination of the State Statistics Service of Ukraine (SSSU), with technical and financial support from UNICEF. The Ukrainian Center for Social Reforms supported survey preparation and implementation, including questionnaire customization, training, household listing and sample preparation, and was responsible for fieldwork, data processing, support to the DIRC validation workshop, and preparation of the Survey Findings Report. The survey provides statistically sound and internationally comparable data essential for developing evidence-based policies and programmes, and for monitoring progress toward national goals and global commitments.

A Commitment to Action: National and International Reporting Responsibilities

More than two decades ago, the **Plan of Action for Implementing the World Declaration on the Survival, Protection and Development of Children in the 1990s** called for:

> "Each country should establish appropriate mechanisms for the regular and timely collection, analysis and publication of data required to monitor relevant social indicators relating to the well-being of children .... Indicators of human development should be periodically reviewed by national leaders and decision makers, as is currently done with indicators of economic development..."

The Multiple Indicator Cluster Surveys Programme was developed soon after, in the mid-1990s, to support countries in this endeavour.

Governments that signed the **World Fit for Children Declaration and Plan of Action** also committed themselves to monitoring progress towards the goals and objectives:

> "We will monitor regularly at the national level and, where appropriate, at the regional level and assess progress towards the goals and targets of the present Plan of Action at the national, regional and global levels. Accordingly, we will strengthen our national statistical capacity to collect, analyse and disaggregate data, including by sex, age and other relevant factors that may lead to disparities, and support a wide range of child-focused research" (***A World Fit for Children***, paragraph 60)

Similarly, the **Millennium Declaration** (paragraph 31) called for periodic reporting on progress:

> "...We request the General Assembly to review on a regular basis the progress made in implementing the provisions of this Declaration, and ask the Secretary-General to issue periodic reports for consideration by the General Assembly and as a basis for further action."

The General Assembly Resolution, adopted on 25 September 2015, "**Transforming Our World: the 2030 Agenda for Sustainable Development**" stipulates that for the success of the universal Sustainable Development Goals (SDG) agenda,

> "quality, accessible, timely and reliable disaggregated data will be needed to help with the measurement of progress and to ensure that no one is left behind" (paragraph 48); recognises that "...baseline data for several of the targets remains unavailable..." and calls for "...strengthening data collection and capacity building in Member States..."

The 2025–26 Ukraine MICS is part of a broader national effort to strengthen evidence for child rights monitoring, recovery planning and reporting against national and international commitments. Ukraine has nationalised the Sustainable Development Goals (SDG) and established a national SDG monitoring system. The SSSU is responsible for collecting, processing and publishing data on national SDG indicators; following the 2024 update of the national SDG framework and the list of indicators approved by the Cabinet of Ministers of Ukraine, the national Open SDG Platform was modernised.

The survey is particularly important in the context of the full-scale war, which has increased the need for reliable, disaggregated and internationally comparable data on children, adolescents, women and households. MICS findings will support national planning, policy dialogue and reporting under Ukraine's national SDG monitoring framework and other child-focused policy processes, including recovery planning and the implementation of child rights and child well-being commitments.

The 2025-26 Ukraine MICS results are critically important for SDG monitoring. The survey produces data for a range of global SDG indicators, including indicators on child mortality, maternal and reproductive health, child nutrition, early childhood development, education, youth participation in education and employment, child protection, water, sanitation and hygiene, discrimination, and access to information and communication technologies. Several MICS indicators correspond directly or closely to Ukraine's national SDG indicators, including under-five mortality, youth not in

employment, education or training, adolescent fertility, and participation in education and training. In other areas, such as child nutrition, WASH, child protection and ICT access and use, MICS provides internationally comparable household survey measures that complement Ukraine's nationalised SDG indicators, which are often based on administrative, sectoral or infrastructure data.

The survey also provides information that cannot be obtained from administrative sources alone. It helps assess the situation of children and families in Ukraine, identify disparities by sex, age, area of residence, household characteristics and other factors, and inform future action. In this way, the 2025-26 Ukraine MICS contributes to Ukraine's evidence base for monitoring progress, strengthening accountability and supporting data-informed decisions for children, adolescents, women and households.

The 2025-26 Ukraine MICS has as its primary objectives:

- To provide high quality data for assessing the situation of children, adolescents, women and households in Ukraine;
- To furnish data needed for monitoring progress toward national goals, as a basis for future action;
- To collect disaggregated data for the identification of disparities, to inform policies aimed at social inclusion of the most vulnerable;
- To validate data from other sources and the results of focused interventions;
- To generate data on national and global SDG indicators;
- To generate internationally comparable data for the assessment of the progress made in various areas, and to put additional efforts in those areas that require more attention;
- To generate behavioural and attitudinal data not available in other data sources.

This report presents the results of the 2025-26 Ukraine MICS.

Following chapter 2 on survey organisation and methodology, including sample design and implementation, all indicators covered by the survey, with their definitions, are presented in chapter 3 "Indicators and definitions". Prior to presenting the survey results, organised into thematic chapters, the coverage of the sample and the main characteristics of respondents is covered in chapter 4, "Sample coverage and characteristics of respondents".

From Chapter 5, all survey results are presented in eight thematic chapters. In each chapter, a brief introduction of the topic and the description of all tables, are followed by the tabulations. Chapter 5, "Survive", includes findings on under-5 mortality.

This is followed by chapter 6, "Thrive – Reproductive, maternal, newborn, and adult health", which presents findings on fertility, early childbearing, contraceptive use, need and demand for family planning, antenatal care, delivery care, post-natal care, and ends with tobacco use.

The following chapter 7, "Thrive – Child health, nutrition, and development" presents findings on HPV immunisation, symptoms of acute respiratory infection, infant and young child feeding, malnutrition, early childhood development, and early childhood development index.

"Learn and acquire skills" is the topic of the next chapter 8, where survey findings on early childhood education, attendance, household involvement in education, youth employment and training, and Information and Communication Technology (ICT) equipment, use, and skills are covered.

The next chapter 9, "Protected from violence and exploitation", includes survey results on child discipline, child labour, child marriage, feelings of safety, and attitudes toward domestic violence.

Chapter 10, "Live In a safe and clean environment", covers the topics of drinking water, handwashing, and sanitation.

The next chapter 11 is on equity – titled "Equitable chance in life", the chapter presents findings on a range of equity related topics, including child functioning, discrimination and harassment, and reproductive agency.

The final thematic chapter, Chapter 12, "Post-emergency," describes the effects of the Russian Federation's full-scale invasion, which began on 24 February 2022, on Ukrainian households, based on a set of specific survey measures.

The report ends with appendices, with detailed information on sample design, personnel involved in the survey, estimates of sampling errors, data quality, and the questionnaires used.

2. Survey organisation and methodology

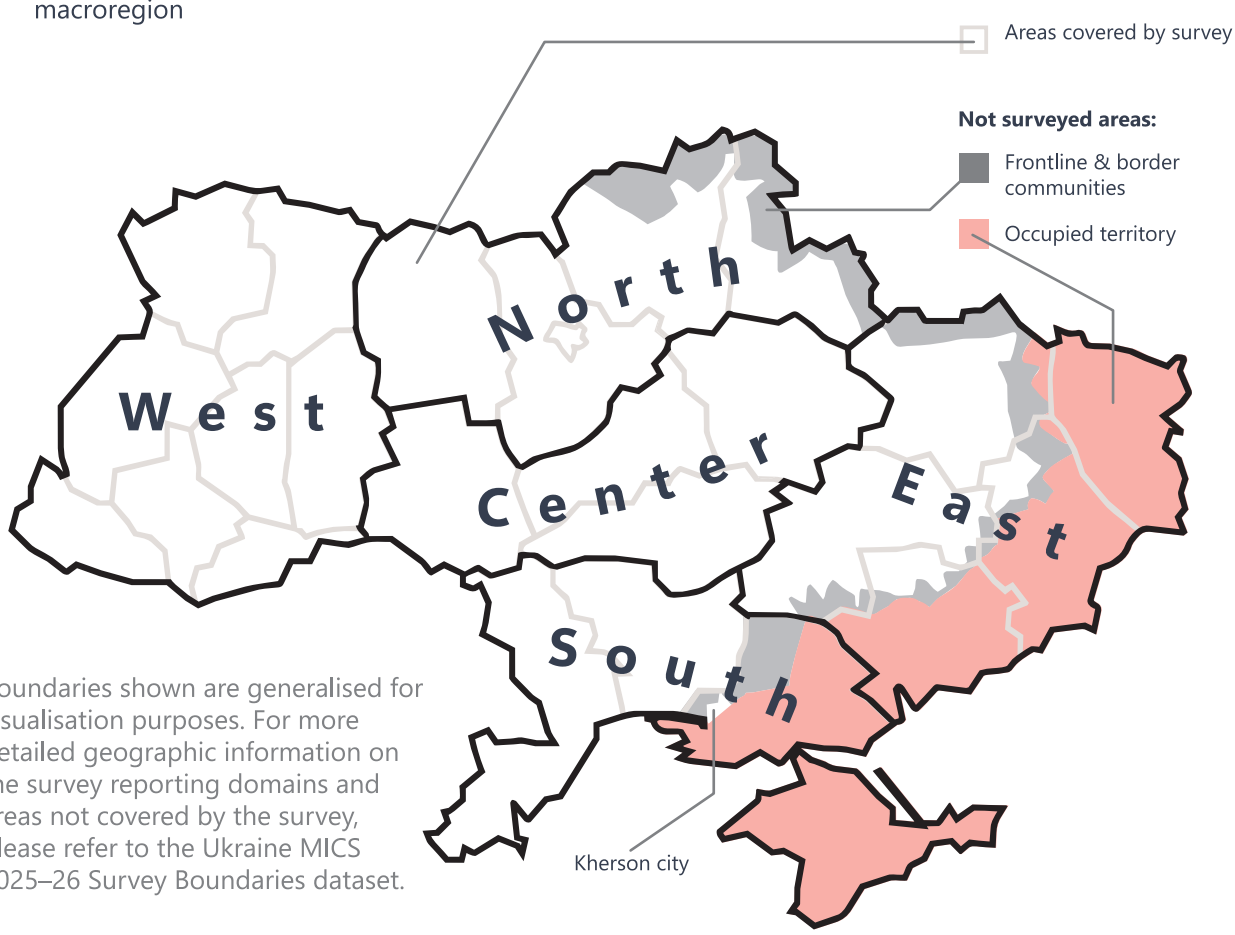

2.1 Survey organisation

The 2025-26 Ukraine MICS was implemented by a Survey Management Team formed and led by the Department of Social Statistics of the SSSU and UNICEF. Oversight was provided by a Steering Committee and technical decisions and processes were guided and supported by a Technical Committee.[3] The Global MICS Team of UNICEF provided on and off-site support and reviews during key phases of the survey as per the standard Technical Collaboration Framework of the global MICS programme and the Memorandum of Understanding between the SSSU and UNICEF.

2.2 Sample design

The sample for the 2025-26 Ukraine MICS was designed to provide estimates for a large number of indicators on the situation of children and women at the national level, for urban and rural areas, and for 24 regions[4]. For presentation in this report, regional results are aggregated into five macroregions, using the same grouping as in the 2012 Ukraine MICS to support comparison over time:

- Kyiv city, and Kyiv, Zhytomyr, Sumy, and Chernihiv regions, which form the North macroregion
- Ivano-Frankivsk, Khmelnytskyi, Chernivtsi, Lviv, Rivne, Ternopil, Volyn, and Zakarpattia regions, which form the West macroregion
- Cherkasy, Poltava, Kirovohrad, and Vinnytsia regions, which form the Center macroregion
- Dnipropetrovsk, Donetsk, Luhansk, Zaporizhia, and Kharkiv regions, which form the East macroregion
- The Autonomous Republic of Crimea, Sevastopol city, Odesa, Mykolaiv and Kherson regions, which form the South macroregion

Boundaries shown are generalised for visualisation purposes. For more detailed geographic information on the survey reporting domains and areas not covered by the survey, please refer to the Ukraine MICS 2025–26 Survey Boundaries dataset.

[3] Membership of the MICS Survey Team, Steering and Technical Committees are listed in Appendix B.

[4] For security reasons, the sample frame covered only government-controlled territory and areas where it was feasible to conduct the survey in terms of security. Therefore, the following were excluded from the sample frame: the Luhansk region (East macroregion), the Autonomous Republic of Crimea and the city of Sevastopol (South macroregion), and hromadas bordering the front line and Russian Federation (with the exception of Kherson city, which was included).

Results from the 2025-26 Ukraine MICS relate only to territories covered by the survey and do not represent temporarily occupied territories or other areas excluded from the sampling frame because of security and access constraints.

The sample was stratified by region and type of area (urban and rural), resulting in 46 sampling strata, as the Kherson city (the only part of Kherson region where the survey was feasible) and Kyiv city have no rural areas. The sample was selected in two stages, with segmentation applied as an intermediate procedure where required. The sampling frame was developed by combining population estimates and administrative data from several sources. The Voting Areas (VA), or electoral precincts, formed the Primary Sampling Units (PSUs). The sizes of PSUs were revised based on population estimates for 2024. The principal source for population totals and their distribution by age and sex was the UNFPA Common Operational Dataset on Population Statistics (COD-PS), which provided estimates at national, regional and district levels (as updated in September 2024). Within the VAs, each VA that included more than 350 households was divided into approximately equal-sized segments around 120 households, one of which was selected with probability proportional to the size. Where the VA contained fewer than 70 households, it was merged with a neighboring VA to create a cluster of around 120 households. For remaining VAs, in all other cases, the entire VAs formed clusters. A total of 1,000 clusters were selected for the 2025-26 Ukraine MICS at the first sampling stage, and a sample of 24 households was selected in each sample cluster at the second stage, for a total sample size of 24,000 households. It should be noted that 12 of the selected clusters were not visited because they were inaccessible due to safety concerns and remained inaccessible during the fieldwork period.

A listing of households was conducted in each sample cluster, and a sample of 24 households was selected, after the further stratification into two substrata: households with children under five years of age and households without children under five. In order to perform an over-sampling strategy for households with under-five children, of the 24 households selected in each cluster, the target number of sample households with children under age 5 years was 12.

As the sample is not self-weighting, sample weights are used for reporting survey results. A more detailed description of the sample design can be found in Appendix A: Sample Design.

2.3 Questionnaires

Four questionnaires were used in the survey:

1) a household questionnaire to collect basic demographic information on all *de jure* household members (usual residents), the household and the dwelling, and a water quality testing form along with water quality lab testing form administered in 5 households in each cluster of the sample,
2) a questionnaire for women administered in each household to all women age 15-49 years
3) an under-5 questionnaire, administered to mothers (or caregivers) of all children under 5 living in the household, and
4) a questionnaire for children and adolescents age 5-17 years, administered to the mother (or caregiver) of one randomly selected child age 5-17 years living in the household.[5]

The questionnaires included the following modules:

Household Questionnaire
List of Household Members
Education: Attainment
Education: Attendance
Household Characteristics
Household Energy Use
Post-emergency
Water
Sanitation
Hygiene
Water Quality Testing Form
Water Quality Lab Testing Form

Questionnaire for Women Age 15-49
Woman's Background
Migration
Employment and Training
ICT Use
Fertility/Birth History
Desire for Last Birth
Antenatal Care
Delivery Care
Period Return
Initial Breastfeeding
Signal Care Functions
Contraception
Unmet Need
HPV
Attitudes Toward Domestic Violence
Safety
Discrimination
Marriage/Union
Adult Functioning
Sexual Activity
Reproductive Agency
Tobacco Use

Questionnaire for Children and Adolescents Age 5-17 Years
Child's Background
Child Labour
Child Discipline
Child Functioning
Household Involvement in Education
Anthropometry [5-9]

Questionnaire for Children Under 5
Under-Five's Background
Early Childhood Development
Child Discipline
Child Functioning
Breastfeeding and Dietary Intake
Symptoms of ARI: Care-seeking and Treatment
Anthropometry [0-4]

In addition to the administration of questionnaires, fieldwork teams observed the place for handwashing, measured the weights and heights of children age under 5 years and 5-9 years, and tested household drinking and source water for *E. coli* levels. Laboratory personnel collected samples from households' main drinking water sources and tested them for five physicochemical parameters: iron, nitrate, free residual chlorine, colour and turbidity. Details and findings of these observations, measurements, and laboratory analyses are provided in the respective sections of the report.

The questionnaires were based on the MICS7 standard questionnaires.[6] From the MICS7 model English version of the

[5] Children age 15-17 years living without their mother and with no identified caregiver in the household were considered emancipated and the questionnaire for children and adolescents age 5-17 years was administered directly to them. This slightly reworded questionnaire that only includes the Child's Background, Child Labour, and Child Functioning modules is not reproduced in Appendix E: Questionnaire.

[6] https://mics.unicef.org/tools#survey-design

questionnaires were customised and translated into Ukrainian and were pre-tested at four locations in Kyiv city and Kyiv region, covering both urban and rural areas, during June 2025. Based on the results of the pre-test, modifications were made to the wording and translation of the questionnaires. A copy of the 2025-26 Ukraine MICS questionnaires is provided in Appendix E in Ukrainian and English.

2.4 Ethics

The 2025-26 Ukraine MICS adhered to standard guidelines for ethics in data collection, including informed consent procedures, a protection protocol, ethical review of MICS plans and protocols, and measures to protect the confidentiality of the data, and ensure the safe conduct of interviews and interactions with respondents. These measures included involving only female interviewers, as well as training interviewers on sensitive interviewing techniques, ensuring privacy, and managing interruptions during interviews.

2.4.1 Protection protocol and ethics review

The 2025-26 Ukraine MICS protection protocol identified risks throughout the survey lifecycle in the following areas: potential harms and benefits for participants, the informed consent process, privacy and confidentiality, risks to interviewers, and handling participant complaints and concerns. The protocol also outlined the measures and procedures adopted to address or mitigate these risks. It was developed and reviewed as part of the broader survey quality assurance process by the 2025-26 Ukraine MICS year Steering and Technical Committees. The survey plan, questionnaires, and protection protocol were submitted for ethics review and approved by the Commission on Professional Ethics of the Sociological Association of Ukraine in July 2025.

2.4.2 Informed consent procedures

Verbal informed consent was obtained from all respondents. Permission to interview household members between the ages of 15 and 17 was also obtained from the respondent to the Household Questionnaire prior to the adolescents being interviewed.

As part of the informed consent process, all respondents were informed about the purpose of the survey, that participation was voluntary, their responses would remain confidential and anonymous, and they had the right to refuse to answer any questions or to stop the interview at any time.

At the conclusion of each questionnaire, respondents were invited to provide verbal consent to participate in a follow-up survey conducted via phone. They were informed that participation was entirely voluntary, that their information would remain anonymous, and that they had the right to withdraw at any time. If consent was granted, respondents were asked to provide their personal or the household's shared phone number, with the explicit instruction not to share phone numbers belonging to other household members or individuals outside their household.

2.4.3 Data protection

During data collection, tablets used for interview capture are password-protected and equipped with encryption protocols to ensure the security of all recorded responses. Data are transmitted securely to the central server using CSPro's (Census and Survey Processing System) CSWeb platform, which supports encrypted data transfer over secure channels. Once received, the data are stored on protected servers with restricted access. Prior to any analysis or dissemination, the dataset undergoes a systematic anonymisation process. This includes the removal of any personally identifiable or confidential information while preserving all questionnaire-based variables necessary for valid statistical analysis.[7]

2.5 Data collection method

MICS surveys utilise Computer-Assisted Personal Interviewing (CAPI). The data collection application was based on the CSPro software, Version 7.7.3, including a MICS dedicated data management and monitoring platform developed in Power BI and integrated into the Microsoft Teams platform. Procedures and standard programs[8] developed under the global MICS programme were adapted to the 2025-26 Ukraine MICS final questionnaires and used throughout. The CAPI application was tested in Kyiv city and Kyiv region, covering both urban and rural areas, during July 2025. Based on the results of the CAPI-test, modifications were made to the questionnaires and application.

[7] Please also see section 2.11 below for further detail on anonymisation and data sharing.

[8] http://mics.unicef.org/tools#data-processing

2.6 Training

Training for the fieldwork was conducted for 17 days in August 2025. Training included lectures on interviewing techniques and the contents of the questionnaires, and mock interviews between trainees to gain practice in asking questions. Participants first completed full training on paper questionnaires, followed by training on the CAPI application. The trainees spent 3 days in field practice and 2 days on a full pilot survey in Kyiv city and Kyiv region, covering both urban and rural areas. The training agenda was based on the template MICS7 training agenda[9].

All measurers received dedicated trainings. For anthropometry, the training schedule was for a total of 6 days, including 2 days of practice at the venue with invited children aged 0-9, dedicated standardisation tests[10], and pilot. For water quality testing, the training schedule was for a total 6 days, including the pilot survey together with the full team of fieldworkers.

Field Supervisors attended additional training on the duties of team supervision and responsibilities.

A series of refresher training sessions was conducted for field staff due to the gap of more than one week between the main training and the start of data collection. These sessions aimed to refresh interviewers' practical skills and recall fieldwork protocols. The two-day refresher training was followed by visits from the Fieldwork Coordinator and key project experts to each team at the start of their respective fieldwork wave. During these visits, each team was provided with final briefings in the field, support during their first interviews and procedural oversight to ensure consistent implementation of the survey protocols.

2.7 Fieldwork

The data were collected by 26 teams; each was comprised of 2-4 interviewers, one measurer and a supervisor. Fieldwork began in October 2025 and concluded in March 2026.

Data was collected using tablet computers running the Android operating system, utilising a Bluetooth application for field operations, enabling transfer of assignments and completed questionnaires between supervisor and interviewer tablets.

In situations where the use of electronic devices posed security concerns, or where tablet performance was affected by power outages and extremely sub-zero temperatures during the fieldwork period in Ukraine, a significant proportion of questionnaires were completed on paper. In these cases, the field teams transferred the answers from the completed paper questionnaires into the data collection app on the tablets as soon as possible. This should therefore be taken into account when interpreting the interview durations in Table DQ.8.3, since the calculation for this table is based on the start and end times recorded by the tablets.

2.8 Fieldwork quality control measures

Team supervisors were responsible for the daily monitoring of fieldwork. Mandatory re-interviewing was implemented on one household per cluster. Daily observations of interviewer skills and performance were conducted.

During the fieldwork period, each team was visited multiple times by survey management team members and field visits were arranged for UNICEF MICS Team members.

Throughout the fieldwork, field check tables (FCTs) were produced weekly for analysis and action with field teams. The FCTs were customised versions of the standard tables produced by the MICS Programme.[11]

[9] https://mics.unicef.org/tools/MICS7#survey-design

[10] Standardisation tests are structured measurements of a group of children, with each trainee measuring each child. This allows the expert trainers to assess trainees quantitatively by comparing test results between trainees and against expert measurements. They also serve as opportunities for more qualitative observations enabling the expert trainers to address behaviour with children and mothers, adherence to measurement protocols, and to underscore the rigour necessary on every measurement, even when conditions are less than ideal.

[11] http://mics.unicef.org/tools#data-collection

Additionally, the survey management team employed real-time dashboard data summaries, as well as detailed interviewer performance monitoring, both novel approaches to implementation and data quality monitoring developed by the MICS Programme.

2.9 Data management and editing

Data were received at the UCSR's central office via CSWeb, a web-based data management system designed to work with CSPro and integrated into the management application on the supervisors' tablets. Whenever logistically possible, synchronisation was daily. The central office communicated application updates to field teams through this system.

During data collection and following the completion of fieldwork, data were edited according to the editing process described in detail in the Data Editing Guidelines, a customised version of the standard MICS documentation.[8]

2.10 Analysis and reporting

Sample weights and background characteristics were computed and added to the final data. Analysis was done using the Statistical Package for Social Sciences (SPSS) software, Version 24. Model syntax and tabulation plan developed by UNICEF were customised and used for this purpose.[12]

The Survey Findings Report and accompanying Statistical Snapshots were drafted based on the templates developed by the global MICS Programme.[13] These were presented and reviewed by subject matter experts during the Data Interpretation and Report Compilation (DIRC) Workshop held in Kyiv city on 18 – 22 May 2026. The finalisation of the Survey Findings Report and Statistical Snapshots was managed by the Survey Management Team with guidance from the Technical Committee and the participants in the DIRC Workshop.

2.10.1 Degree of Urbanisation (DEGURBA)

In addition to the national and administrative reporting domains, survey results are presented by Degree of Urbanisation (DEGURBA), an internationally harmonised classification of settlement types. DEGURBA classifies the entire territory of a country into three categories: cities (high degree of urbanisation), towns and semi-dense areas (moderate degree of urbanisation), and rural areas (low degree of urbanisation).[14] By applying a common methodology across countries, it provides a consistent and internationally comparable framework for analysing survey indicators by settlement type.

For 2025-26 Ukraine MICS, DEGURBA was derived following the standard Global Human Settlement (GHS) DEGURBA methodology. Population estimates from the MICS sampling frame were redistributed to a high resolution population grid (~1 km) and combined with the Global Human Settlement Layer (GHSL) 2025 built up surface dataset[15] using the GHSL GHS-DEGURBA toolkit (v2.13)[16] to generate a national DEGURBA grid. Population weighted DEGURBA classifications were then assigned to the selected PSUs, which form the basis for the DEGURBA disaggregation presented in this report.

Unless otherwise indicated, all indicator tables include disaggregation by DEGURBA alongside the standard MICS background characteristics.

[16] https://human-settlement.emergency.copernicus.eu/tools.php

2.11 Data sharing

Unique identifiers such as location and personal details collected during interviews were removed from datasets to ensure privacy.[17] These anonymised data files are made available on stat.gov.ua website[18] and on the MICS website[19] and can be freely downloaded for legitimate research purposes. Users are required to submit final research to entities listed in the included readme file, strictly for information purposes.

Geocode, i.e., latitude and longitude, is available for each survey cluster. To ensure respondent protection, cluster-level GPS (Global Positioning System) coordinates are randomly displaced.[20] Anonymised geocodes are made available on stat.gov.ua website[18] and on the MICS website,[21] as indicated in the readme file included with the data. Specific terms of use apply, such as submission of research scope.

Survey boundaries, that is, the boundaries of geographic reporting domains are freely available on stat.gov.ua website[18] and on the MICS website[21].

In addition, a geospatial covariates dataset containing environmental, climatic, accessibility, and socioeconomic indicators linked to survey clusters, macroregions, and regions is available on the MICS website to support spatial and contextual analyses.[22]

All materials used during the preparation of the survey process, implementation and conclusion of the survey have been archived.

3. Indicators and definitions

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
SAMPLE COVERAGE AND CHARACTERISTICS OF THE RESPONDENTS						
Base Questionnaire Indicators[26]						
SR.1	Access to consistent sources of electricity	7.1.1	HC	Percentage of household members with access to consistent sources of electricity	SR.2.1	99.7
SR.18	Children's living arrangements		HL	Percentage of children age 0-17 years living with neither biological parent	SR.9.1 / SR.9.3	2.8
SR.19	Prevalence of children with one or both parents dead		HL	Percentage of children age 0-17 years with one or both biological parents dead	SR.9.1	6.6
SR.20	Children with at least one parent living abroad		HL	Percentage of children age 0-17 years with at least one biological parent living abroad	SR.9.2	5.9
Complementary Questionnaire Topic Indicators[26]						
SR.601	Primary reliance on clean fuels and technologies for cooking		EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking (living in households that reported cooking)	SR.6.1	97.9
SR.602	Primary reliance on clean fuels and technologies for space heating		EU	Percentage of household members with primary reliance on clean fuels and technologies for space heating (living in households that reported the use of space heating)	SR.6.3	81.9
SR.603	Primary reliance on clean fuels and technologies for lighting		EU	Percentage of household members with primary reliance on clean fuels and technologies for lighting (living in households that reported the use of lighting)	SR.6.4	99.9
SR.604	Primary reliance on clean fuels and technologies for cooking, space heating and lighting	7.1.2	EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking, space heating and lighting[27]	SR.6.5	81.7
SURVIVE[28]						
CS.1	Neonatal mortality rate	3.2.2	BH	Probability of dying within the first month of life	CS.1-3	6
CS.2	Post-neonatal mortality rate		BH	Difference between infant and neonatal mortality rates	CS.1-3	4
CS.3	Infant mortality rate		CM / BH	Probability of dying between birth and the first birthday	CS.1-3	10
CS.4	Child mortality rate		BH	Probability of dying between the first and the fifth birthdays	CS.1-3	3
CS.5	Under-five mortality rate	3.2.1	CM / BH	Probability of dying between birth and the fifth birthday	CS.1-3	12
THRIVE - REPRODUCTIVE, MATERNAL, NEWBORN, AND ADULT HEALTH						
Base Questionnaire Indicators[26]						
TM.1a TM.1b	Adolescent birth rate	3.7.2	CM / BH	Age-specific fertility rate for women age (a) 10-14 years[29] (b) 15-19 years	TM.1.1 TM.1.1-2	0 11
TM.2	Early childbearing		CM / BH	Percentage of women age 20-24 years who have had a live birth before age 18	TM.2.2W	1.9

[23] Sustainable Development Goal (SDG) Indicators, http://unstats.un.org/sdgs/indicators/indicators-list/. Metadata for the SDG Indicators are regularly updated. MICS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered. The latter cases are included here as long as the current international methodology allows only for the MICS Indicator definition, and/or a significant part of the SDG Indicator can be generated by the MICS Indicator. For more information on the metadata of the SDG Indicators, see http://unstats.un.org/sdgs/metadata/

[24] Some indicators are constructed using questions in more than one topic/module in the MICS questionnaires. In such cases, only the topic(s)/module(s) which contain(s) most of the necessary information is indicated. Refer to the MICS7 Questionnaire Topics for the full name of modules.

[25] All MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, disability, and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency and Expert Group on SDG Indicators: Global indicator framework for the Sustainable Development Goals and targets of the 2030 Agenda for Sustainable Development

[26] The MICS7 List of Indicators is presented by Survey Findings Report chapter. Within each chapter, the list is divided between indicators captured in the Base Questionnaires and those available through the Complementary Questionnaire Topics.

[27] Household members living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator.

[28] Mortality indicators are calculated for the last 5-year period.

[29] Adolescent birth rates are collected through the Birth History module in the Questionnaire for Women, administered to all women age 15-49. Rates for the 10-14 age group are therefore computed based on retrospective birth history data of women age 15-17 years.

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
TM.5a TM.5b TM.5c	Antenatal care coverage	3.8.1	MN	Percentage of women age 15-49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth were attended (a) at least once by skilled health personnel (b) at least four times by any provider (c) at least eight times by any provider	TM.5.1 TM.5.2 TM.5.2	95.1 89.6 72.5
TM.6	Content of antenatal care		MN	Percentage of women age 15-49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth, at least once, had blood pressure measured and gave urine and blood samples as part of antenatal care	TM.5.3	94.0
TM.8	Institutional deliveries		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live birth was delivered in a health facility	TM.6.1	99.9
TM.9	Skilled attendant at delivery	3.1.2	MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live birth was attended by skilled health personnel	TM.6.2	99.9
TM.10	Caesarean section		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live birth was delivered by caesarean section	TM.6.2	19.7
Complementary Questionnaire Topic Indicators[26]						
TM.3	Contraceptive prevalence rate		CP	Percentage of women age 15-49 years currently married or in union who are using (or whose partner is using) a (modern or traditional) contraceptive method	TM.3.1	57.5
TM.4	Need for family planning satisfied with modern contraception[30]	3.7.1 & 3.8.1	UN	Percentage of women age 15-49 years who have their need for family planning satisfied with modern contraceptive methods	TM.4.3	64.8
TM.19	Postnatal signal care functions[31]		PN	Percentage of women age 15-49 years with a live birth in the last 2 years for whom the most recent live-born child received at least 2 postnatal signal care functions within 2 days of birth	TM.8.6	98.9
TM.601	Smoking before age 15		TO	Percentage of woman age 15-49 years who smoked a whole cigarette before age 15	TM.10.1W	4.8
TM.602	Use of tobacco	3.a.1 3.8.1	TO	Percentage of woman age 15-49 years who smoked cigarettes or used smoked or smokeless tobacco products at any time during the last one month	TM.10.2W	23.9
THRIVE - CHILD HEALTH, NUTRITION, AND DEVELOPMENT						
Base Questionnaire Indicators[26]						
TC.44a TC.44b	Underweight prevalence		AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median weight for age of the WHO standard	TC.8.1	1.6 0.2
TC.45a TC.45b	Stunting prevalence	2.2.1	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) below minus three standard deviations (severe) of the median height for age of the WHO standard	TC.8.1	8.3 1.5
TC.46a TC.46b	Wasting prevalence	2.2.2	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median weight for height of the WHO standard	TC.8.1	6.1 2.2
TC.47a TC.47b	Overweight prevalence	2.2.2	AN	Percentage of children under age 5 who are above (a) two standard deviations (moderate and severe) (b) three standard deviations (severe) of the median weight for height of the WHO standard	TC.8.1	6.3 2.1

[30] Refer to tables for a detailed description.

[31] Signal functions are 1) Checking the cord, 2) Counseling on danger signs, 3) Assessing temperature,4) Observing/counseling on breastfeeding, and 5) Weighing the baby (where applicable).

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
TC.49a TC.49b TC.49c	Early stimulation and responsive care		EC	Percentage of children age 24-59 months engaged in four or more activities to provide early stimulation and responsive care in the last 3 days with (a) Any adult household member (b) Father (c) Mother	TC.9.1	95.8 29.5 89.9
TC.50	Availability of children's books		EC	Percentage of children under age 5 who have three or more children's books	TC.9.2	90.4
TC.51	Availability of playthings		EC	Percentage of children under age 5 who play with two or more types of playthings	TC.9.2	72.1
TC.52	Inadequate supervision		EC	Percentage of children under age 5 left alone or under the supervision of another child younger than 10 years of age for more than one hour at least once in the last week	TC.9.3	10.2
TC.53	Early childhood development index 2030	4.2.1	EC	Percentage of children age 2-4 years who are developmentally on track in health, learning, and psychosocial well-being	TC.10.1	73.1
Complementary Questionnaire Topic Indicators[26]						
TC.701	HPV immunisation coverage	3.b.1	HP	Percentage of adolescent girls age 15 years who received two doses of HPV vaccine at any time before the survey	TC.2.1	7.2
TC.19	Care-seeking for children with acute respiratory infection (ARI) symptoms	3.8.1	AR	Percentage of children under age 5 with ARI symptoms in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	TC.5.1	84.2
TC.30	Children ever breastfed		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were ever breastfed	TC.7.1	83.7
TC.31	Early initiation of breastfeeding		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	TC.7.1	74.1
TC.32	Exclusive breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who are exclusively breastfed[32]	TC.7.2	42.7
TC.38	Introduction of solid, semi-solid or soft foods		BD	Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	TC.7.3	75.0
TC.39	Minimum acceptable diet		BD	Percentage of children age 6-23 months who had at least the minimum dietary diversity and the minimum meal frequency during the previous day	TC.7.4	62.8
TC.40	Minimum milk feeding frequency for non-breastfed children		BD	Percentage of non-breastfed children age 6-23 months who received at least 2 milk feedings during the previous day	TC.7.4	90.4
TC.41	Minimum dietary diversity	2.2.4	BD	Percentage of children age 6-23 months who received foods from 5 or more of the 8 defined food groups[33] during the previous day	TC.7.4	74.5
TC.42	Minimum meal frequency		BD	Percentage of children age 6-23 months who received solid, semi-solid and soft foods (plus milk feeds for non-breastfed children) the minimum number of times[34] or more during the previous day	TC.7.4	80.9
TC.43	Bottle feeding		BD	Percentage of children age 0-23 months who were fed with a bottle during the previous day	TC.7.2	61.1

[32] Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements, and medicines.

[33] The 8 defined food groups are: 1) breastmilk, 2) grains, roots, and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry, and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

[34] Breastfeeding children: Solid, semi-solid, or soft foods, two times for infants age 6-8 months, and three times for children 9-23 months; Non-breastfeeding children: Solid, semi-solid, or soft foods, or milk feeds, four times for children age 6-23 months.

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
TC.702	Exclusively breastfed for the first two days after birth		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were fed exclusively with breast milk for the first two days after birth	TC.7.1	68.3
TC.703	Mixed milk feeding under 6 months		BD	Percentage of infants under 6 months of age who received formula and/or animal milk in addition to breast milk during the previous day	TC.7.2	10.2
TC.704	Continued breastfeeding 12-23 months		BD	Percentage of children age 12-23 months who received breast milk during the previous day	TC.7.2	27.7
TC.705	Child food poverty		BD	Percentage of children age 6-23 months who received foods from 4 or fewer of the 8 defined food groups[33] during the previous day	TC.7.5	25.5
TC.706	Egg and/or flesh food consumption		BD	Percentage of children age 6-23 months who consumed egg and/or flesh food during the previous day	TC.7.6	87.0
TC.707	Sweet beverage consumption		BD	Percentage of children age 6-23 months who consumed a sweet beverage during the previous day	TC.7.7	56.0
TC.708	Unhealthy food consumption		BD	Percentage of children age 6-23 months who consumed selected sentinel unhealthy foods[35] during the previous day	TC.7.7	20.7
TC.709	Zero vegetable or fruit consumption		BD	Percentage of children age 6-23 months who did not consume any vegetables or fruits during the previous day	TC.7.7	6.5
TC.710a TC.710b	Thinness prevalence (age 5-9 years)		FA	Percentage of children age 5-9 years who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median Body Mass Index (BMI)-for-age of the 2007 WHO Growth Reference for school-age children and adolescents	TC.8.2	3.9 1.3
TC.711a TC.711b	Overweight prevalence (age 5-9 years)		FA	Percentage of children age 5-9 years who are above (a) plus one standard deviations (moderate and severe) (b) plus two standard deviations (severe) of the median Body Mass Index (BMI)-for-age of the 2007 WHO Growth Reference for school-age children and adolescents	TC.8.2	25.7 8.0
TC.712a TC.712b	Low height-for-age (age 5-9 years)		FA	Percentage of children age 5-9 years who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median height-for-age of the 2007 WHO Growth Reference for school-age children and adolescents	TC.8.2	6.2 1.6
TC.713a TC.713b	Low weight-for-age (age 5-9 years)		FA	Percentage of children age 5-9 years who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median weight-for-age of the 2007 WHO Growth Reference for school-age children and adolescents	TC.8.2	1.7 0.7
LEARN AND ACQUIRE SKILLS						
Base Questionnaire Indicators[26]						
LN.1	Attendance to early childhood education		UB	Percentage of children age 36-59 months who are attending an early childhood education programme	LN.1.1	48.3
LN.2	Participation rate in organised learning (one year before the official primary entry age) (adjusted)	4.2.2[36]	ED	Percentage of children in the relevant age group (one year before the official primary school entry age) who are attending an early childhood education programme or primary school	LN.1.2	77.3

[35] In the context of this indicator, "sentinel unhealthy foods" are foods or categories of foods (e.g., "sweets" or "candies") that are likely to be consumed by infants and young children and are high in sugar, salt and/or unhealthy fats. Refer to tables for more detailed information.

[36] This SDG indicator is presented with parity indices as per SDG indicator 4.5.1, that is, by sex (female/male), area (rural/urban), household wealth quintile (poorest/richest), and others where possible.

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
LN.3	School readiness		ED	Percentage of children attending the first grade of primary school who attended early childhood education programme during the previous school year	LN.2.1	72.3
LN.4	Net intake rate in primary education		ED	Percentage of children of school-entry age who enter the first grade of primary school	LN.2.2	72.9
LN.5a LN.5b LN.5c	Net attendance rate (adjusted)[37]		ED	Percentage of children of (a) primary school age currently attending primary, lower or upper secondary school (b) lower secondary school age currently attending lower secondary school or higher (c) upper secondary school age currently attending upper secondary school or higher	LN.2.3 LN.2.4 LN.2.6	93.2 92.6 76.9
LN.6a LN.6b LN.6c	Out-of-school rate		ED	Percentage of children of (a) primary school age who are not attending any level of education (b) lower secondary school age who are not attending any level of education (c) upper secondary school age who are not attending any level of education	LN.2.3 LN.2.4 LN.2.6	3.3 1.2 3.2
LN.7a LN.7b	Gross intake ratio to the last grade[37]		ED	Ratio of children attending the last grade for the first time to children at appropriate age to the last grade (a) Primary school (b) Lower secondary school	LN.2.7	91.2 98.1
LN.8a LN.8b LN.8c	Completion rate	4.1.2[36]	ED	Percentage of children age 3-5 years above the intended age for the last grade who have completed that grade (a) Primary school (b) Lower secondary school (c) Upper secondary school	LN.2.7	98.8 99.2 94.8
LN.9	Effective transition rate to lower secondary school[37]		ED	Percentage of children attending the last grade of primary school during the previous school year and not repeating in the current school year who are attending the first grade of lower secondary school in the current school year	LN.2.7	99.8
LN.10a LN.10b	Over-age for grade		ED	Percentage of children attending school who are at least 2 years above the intended age for grade (a) Primary school (b) Lower secondary school	LN.2.5	3.4 3.7
LN.604	Households with a radio		HC	Percentage of households that have a radio	LN.6.1	15.8
LN.605	Households with a television		HC	Percentage of households that have a television	LN.6.1	93.2
LN.606	Households with a telephone		HC IC	Percentage of households that have a telephone (fixed line or mobile phone)	LN.6.1	96.6
LN.607	Households with a computer		HC	Percentage of households that have a computer	LN.6.1	50.3
LN.608	Households with internet		HC	Percentage of households that have access to the internet by any device from home	LN.6.1	84.2
LN.609	Use of computer		IC	Percentage of woman age 15-49 years who used a computer during the last 3 months	LN.6.2W	75.9
LN.610a LN.610b	Ownership of mobile phone	5.b.1	IC	Percentage of woman age 15-49 years who own a (a) mobile phone (b) smartphone	LN.6.2W	98.7 97.6
LN.611	Use of mobile phone		IC	Percentage of woman age 15-49 years who used a mobile telephone during the last 3 months	LN.6.2W	99.1
LN.612a LN.612b	Use of internet	17.8.1	IC	Percentage of woman age 15-49 years who used the internet (a) during the last 3 months (b) at least once a week during the last 3 months	LN.6.2W	97.1 95.6

[37] Parity indices for this indicator are presented in the indicator tabulation by sex (female/male), area (rural/urban), and household wealth quintile (poorest/richest).

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
LN.613a LN.613b	ICT skills	4.4.1[36]	IC	Percentage of woman who have carried out at least one specific computer related activity during the last 3 months (a) age 15-24 (b) age 15-49	LN.6.3W	91.8 85.6
Complementary Questionnaire Topic Indicators[26]						
LN.12	Availability of information on children's school performance		PR	Percentage of children age 7-14 years attending school for whom an adult household member received a report card for the child in the last year	LN.3.1	91.2
LN.13	Opportunity to participate in school management		PR	Percentage of children age 7-14 years attending school for whom their school's governing body is open to parental participation	LN.3.1	92.1
LN.14	Participation in school management		PR	Percentage of children age 7-14 years attending school for whom an adult household member attended a school governing body meeting in the last year	LN.3.1	88.8
LN.16	Discussion with teachers regarding children's progress		PR	Percentage of children age 7-14 years attending school for whom an adult household member discussed child's progress with teachers in the last year	LN.3.1	95.2
LN.18	Availability of books at home		PR	Percentage of children age 7-14 years who have three or more books to read at home	LN.3.2	90.8
LN.21	Support with homework		PR	Percentage of children age 7-14 years attending school and having homework who receive help with homework	LN.3.2	71.1
LN.701	Participation rate of youth in formal and non-formal education and training	4.3.1[36]	NE	Percentage of adolescents and young woman age 15-24 years who attended formal education or attended non-formal education or training in the previous 12 months	LN.5.1	70.8
LN.702	Proportion of youth not in education, employment, or training (NEET)[37]	8.6.1	NE	Percentage of adolescents and young woman age 15-24 years who are not in education, employment, or training	LN.5.1	19.6
LN.703	Early leavers from education and training (ELET)[37]		NE	Percentage of adolescents and young woman who have at most a lower secondary education and did not attend formal or non-formal education or training in the previous 4 weeks	LN.5.1	1.7
PROTECTED FROM VIOLENCE AND EXPLOITATION						
Base Questionnaire Indicators[26]						
PR.2	Violent discipline	16.2.1	UCD – FCD	Percentage of children age 1-14 years who experienced any physical punishment and/or psychological aggression by adult household members in the past one month	PR.2.1	32.0
PR.3	Child labour	8.7.1	CL	Percentage of children age 5-17 years who are involved in child labour[38]	PR.3.3	5.2
PR.4a PR.4b	Child marriage	5.3.1	MA	Percentage of women age 20-24 years who were first married or in union (a) before age 15 (b) before age 18	PR.4.1W PR.4.1W	0.6 7.7
PR.5	Young woman age 15-19 years currently married or in union		MA	Percentage of women age 15-19 years who are married or in union	PR.4.1W	7.4
PR.7a PR.7b	Spousal age difference		MA	Percentage of women who are married or in union and whose spouse is 10 or more years older (a) age 15-19 years (b) age 20-24 years	PR.4.3	(8.4) 6.1

( ) Figures that are based on 25-49 unweighted cases

[38] Child labourers are defined as children involved in economic activities or in household chores above the age-specific thresholds. While the concept of child labour includes exposure to hazardous working conditions, and this is collected in MICS and was previously included in the reported indicator, the present definition, which is also used for SDG reporting, does not include children who are working under hazardous conditions. Refer to tables for more detailed information on thresholds and classifications.

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
Complementary Questionnaire Topic Indicators[26]						
PR.14	Safety	16.1.4	VT	Percentage of woman age 15-49 years feeling safe walking alone in their neighbourhood after dark	PR.6.1W	65.1
PR.15	Attitudes towards domestic violence		DV	Percentage of women age 15-49 years who state that a husband is justified in hitting or beating his wife in at least one of the following circumstances: (1) she goes out without telling him, (2) she neglects the children, (3) she argues with him, (4) she refuses sex with him, (5) she burns the food	PR.7.1W	2.9
Live in a safe and clean environment						
Base Questionnaire Indicators[26]						
WS.1	Use of improved drinking water sources		WS	Percentage of household members using improved sources of drinking water	WS.1.1	98.8
WS.2	Use of at least basic drinking water services	1.4.1 & 6.1.1	WS	Percentage of household members using improved sources of drinking water either on premises (within their dwelling/yard/plot) or within 30 minutes round trip collection time	WS.1.2 / WS.3.9	97.8
WS.2a	Use of improved water sources on premises	6.1.1	WS	Percentage of household members using improved sources of drinking water on premises (within their dwelling/yard/plot)	WS.1.2	83.2
WS.2b	Use of improved water source with water available when needed	6.1.1	WS	Percentage of household members with an improved water source with sufficient drinking water available when needed in the last month	WS.1.5	87.5
WS.3a	Availability of drinking water in the last month	6.1.1	WS	Percentage of household members with a water source with sufficient drinking water available when needed in the last month	WS.1.5	88.5
WS.3b	Availability of drinking water in the last 12 months		WS	Percentage of household members with a water source with sufficient drinking water available when needed in the last 12 months	WS.1.5	85.6
WS.4	Faecal contamination of source water		WQ	Percentage of household members whose source water was tested and with E. coli contamination in source water (point of collection)	WS.1.6	18.5
WS.4a	Use of improved water source free from faecal contamination	6.1.1	WQ	Percentage of household members with an improved drinking water source water and with no E.coli contamination in source water (point of collection)	WS.1.6	81.2
WS.5	Faecal contamination of household drinking water		WQ	Percentage of household members whose household drinking water was tested and with E. coli contamination in household drinking water (point of use)	WS.1.7	24.4
WS.6	Use of safely managed drinking water services	6.1.1	WS – WQ	Percentage of household members with an improved drinking water source on premises, whose source water was tested and free of E. coli and available when needed	WS.1.8 / WS.3.9	54.8
WS.7	Handwashing facility with water and soap at home	1.4.1 & 6.2.1	HW	Percentage of household members with a handwashing facility at home where water and soap or detergent are present	WS.2.1	98.1
WS.701	Bathing facility on premises with water		HW	Percentage of household members with bathing facility on premises (within their dwelling/yard/plot) and with water available	WS.2.2	92.5
WS.8	Use of improved sanitation facilities		WS	Percentage of household members using improved sanitation facilities	WS.3.1	98.9
WS.9	Use of at least basic sanitation services	1.4.1 & 3.8.1 & 6.2.1	WS	Percentage of household members using improved sanitation facilities which are not shared with other households	WS.3.7 / WS.3.9	93.8
WS.10	Safe disposal in situ of waste/excreta from improved on-site sanitation facilities	6.2.1	WS	Percentage of household members with improved on-site sanitation facilities from which waste/excreta has never been emptied or has been emptied and buried in a covered pit	WS.3.5	39.1

MICS INDICATOR		SDG[23]	Topic/ Module[24]	Definition[25]	Table number	Value
WS.11	Removal of waste/excreta from improved on-site sanitation facilities for treatment off-site	6.2.1	WS	Percentage of household members using an improved on-site sanitation facility from which waste/ excreta has been removed off-site for treatment (excluding shared and inadequately contained)	WS.3.8	11.0
WS.12	Safe containment of waste/excreta in improved on-site sanitation facilities		WS	Percentage of household members using an improved on-site sanitation facility which adequately contains waste	WS.3.4	86.3
WS.13	Safely managed on-site sanitation	6.2.1	WS	Percentage of household members with improved on-site sanitation facilities where wastes are safely disposed of in situ (excluding shared and inadequately contained)	WS.3.8	5.0
EQUITABLE CHANCE IN LIFE						
Base Questionnaire Indicators[26]						
EQ.1	Children with functional difficulty		UCF – FCF	Percentage of children age 2-17 years reported with functional difficulty in at least one domain	EQ.1.4	6.6
Complementary Questionnaire Topic Indicators[26]						
EQ.7	Discrimination	10.3.1 & 16.b.1	VT	Percentage of woman age 15-49 years having personally felt discriminated against or harassed within the previous 12 months on the basis of a ground of discrimination prohibited under international human rights law	EQ.3.1W	6.1
EQ.704	Decision-making on reproductive health	5.6.1	DM	Percentage of women age 15-49 years currently married or in union who make their own informed decisions regarding sexual relations, contraceptive use, and reproductive health care	EQ.5.1	70.5
POST-EMERGENCY						
Complementary Questionnaire Topic Indicators[26]						
PE.701a	Households affected by emergency		PE	Percentage of households that experienced the effects of the emergency in at least one of four domains (demographic changes, direct health effects, economic loss, loss of essential services)	PE.6	58.5

4. Sample coverage and characteristics of respondents

4.1 Results of interviews

Table SR.1.1 presents results of the sample implementation, including response rates. Of the 23,708 households selected for the sample, 21,891 were found occupied. Of these, 16,186 were successfully interviewed for a household response rate of 73.9 percent.

The Water Quality Testing Form was administered to five randomly selected households in each cluster, for a total sample of 4,940 households. Among the selected households, the household drinking water was successfully tested in 2,336 households, yielding a response rate of 51.1 percent. Also, 2,165 households were successfully tested for source drinking water quality – a response rate of 47.3 percent.

The Water Quality Laboratory Testing Form was administered in the same households selected for the Water Quality Testing Form. This survey-specific component of the 2025–26 Ukraine MICS complemented the microbiological water quality testing by assessing five physicochemical parameters of drinking water: iron, nitrate, free chlorine, color, and turbidity. The drinking water taken from the water source in 534 households was analyzed in the laboratory, yielding a response rate of 11.7%.

In the interviewed households 8,213 women (age 15-49 years) were identified. Of these, 7,033 were successfully interviewed, yielding a response rate of 85.6 percent within the interviewed households.

There were 3,317 children under age five listed in the household questionnaires. Questionnaires were completed for 3,067 of these children, which corresponds to a response rate of 92.5 percent within interviewed households.

A sub-sample of children age 5-17 years was used to administer the questionnaire for children age 5-17. Only one child was selected randomly in each interviewed household, and there were 5,546 children age 5-17 years listed in the household questionnaires. Of these, 3,887 children were selected, and questionnaires were completed for 3,626, which corresponds to a response rate of 93.3 percent within the interviewed households.

Overall response rates of 63.3 percent, 68.4 percent, 69.0 percent are calculated for the individual interviews of women, under-5s, and children age 5-17 years, respectively.

Table SR.1.1: Results of household, household water quality and lab testing, women's, under-5's, and children age 5-17's interviews

Number of households, households selected for water quality and lab testing, women, children under 5, and children age 5-17 by interview results, by area of residence, degree of urbanisation and region, Ukraine MICS, 2025-26

Children age 5-17 years[C]											
Number of children in interviewed households	5546	2985	2561	1636	1912	1998	1087	2393	838	657	571
Eligible	3887	2257	1630	1264	1392	1231	809	1564	598	483	433
Mothers/caregivers interviewed	3626	2076	1550	1161	1296	1169	742	1513	567	444	360
Children age 5-17's response rate	93.3	92.0	95.1	91.9	93.1	95.0	91.7	96.7	94.8	91.9	83.1
Children age 5-17's overall response rate	69.0	66.9	72.3	66.0	68.4	73.3	65.1	66.5	76.8	71.6	66.9

[A] The Water Quality Testing Form was administered to 5 randomly selected households in each cluster. The response rate within completed households is presented in Table DQ.3.1.

[B] The Water Quality Lab Testing Form was administered to the same households which were selected for Water Quality Testing Form. The response rate within completed households is presented in Table DQ.3.1.

[C] The Questionnaire for Children Age 5-17 was administered to one randomly selected child in each interviewed household.

4.2 Housing and household characteristics

Tables SR.2.1, SR.2.2 and SR.2.3 provide further details on household level characteristics obtained in the Household Questionnaire. Most of the information collected on these housing characteristics have been used in the construction of the wealth index.

Table SR.2.1 presents characteristics of housing, disaggregated by area, degree of urbanisation and macroregion, distributed by whether the dwelling has electricity, energy used for cooking, internet access, the main materials of the flooring, roof[39], and exterior walls, type of dwelling as well as the number of rooms used for sleeping.

In Table SR.2.2 households are distributed according to ownership of assets by households and by individual household members. This also includes ownership of dwelling.

Table SR.2.3 shows the distribution of the household populations by type of area (urban/rural and degree of urbanisation), and macroregion, according to household wealth quintiles.

For details on the Degree of Urbanisation classification and methodology, please refer to Section 2.10.1 of Chapter 2

Table SR.2.1: Housing characteristics

Percent distribution of households by selected housing characteristics, by area of residence, degree of urbanisation and region, Ukraine, 2025-2026

	Total	Area		Degree of urbanisation			Macroregion				
		Urban	Rural	High	Moderate	Low	North	West	Center	East	South

Table SR.3.2: Household members

Compositional features of households, by sex and age groups of interest, and mean household size, Ukraine MICS, 2025-26

	Value	Number of households	
		Weighted	Unweighted
Percentage of households with[A]			
At least one child under age 2 years	1.9	302	844
At least one child under age 5 years	6.5	1049	3029
At least one child age 5-17 years	18.3	2970	3887
At least one child age <18 years	22.1	3582	5694
At least one young person age 18-24 years	8.4	1364	1451
At least one woman age 15-49 years	34.4	5566	7299
At least one man age 15-49 years	30.1	4871	5821
No member age <50 years	55.1	8926	7468
No adult (18+) member	0.0	5	5
Per 100 households, number of			
Children under age 5 years	7.0	16186	16186
Children age 5-17 years	25.4	16186	16186
Women age 15-49 years	39.4	16186	16186
Men age 15-49 years	34.1	16186	16186
Mean household size	**2.02**	**16186**	**16186**

[A] Each proportion is a separate characteristic based on the total number of households.

Tables SR.3.1 and SR.3.2 provide the distribution of households by selected background characteristics, including the sex, age, and education of the household head, as well as area, degree of urbanisation, macroregion, and number of household members. Both unweighted and weighted numbers are presented. Such information is essential for the interpretation of findings presented later in the report and provides background information on the representativeness of the survey sample. The remaining tables in this report are presented only with weighted numbers.[40]

The presented background characteristics are used in subsequent tables in this report; the figures in the table are also intended to show the numbers of observations by major categories of analysis in the report.

The weighted and unweighted total number of households are equal, since sample weights were normalised.[40] The table also shows the weighted mean household size estimated by the survey.

[40] See Appendix A: Sample design, for more details on sample weights.

4.4 Age structure of household population

Table SR.4.1: Age distribution of household population by sex

Percent and frequency distribution of the household population[A] in five-year age groups and child (age 0-17 years) and adult populations (age 18 or more), by sex, Ukraine MICS, 2025-26

	Males		Females		Total	
	Number	Percent	Number	Percent	Number	Percent
Total	**14090**	**100.0**	**18565**	**100.0**	**32655**	**100.0**
Age

[A] As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those found for individuals in tables SR.5.1W, SR.5.2, and SR.5.3 where interviewed individuals are weighted with individual sample weights.

The weighted age and sex distribution of the survey population is provided in Table SR.4.1. In the households successfully interviewed in the survey, a weighted total of 32,655 household members were listed. Of these, 14,090 were males, and 18,565 were females.[41]

[41] The single year age distribution is provided in Table DQ.1.1 in Appendix D: Data quality

4.5 Respondents' background characteristics

Tables SR.5.1W, SR.5.2, and SR.5.3 provide information on the background characteristics of the female respondents 15-49 years of age, children under age 5, and children age 5-17 years. In all these tables, the total numbers of weighted and unweighted observations are equal, since sample weights have been normalised (standardised).[40] Note that in Table SR.5.3, an additional column is presented (Weighted total number of children age 5-17 years) to account for the random selection of one child in households with at least one child age 5-17 years. The final weight of each child is the weight of the household multiplied by the number of children age 5-17 years in the household.

In addition to providing useful information on the background characteristics of women, children age 5-17, and children under age five, the tables are also intended to show the numbers of observations in each background category. These categories are used in the subsequent tabulations of this report.

Table SR.5.1W provides background characteristics of female respondents age 15-49 years. The table includes information on the distribution of women according to area, degree of urbanisation, macroregions, age, education[42], marital status, motherhood status, functional difficulties (for age 18-49), most recent migration, birthplace, citizenship, status of internally displaced person (IDP), and wealth index quintiles.[43, 44]

Background characteristics of children age 5-17 and under 5 are presented in Tables SR.5.2 and SR.5.3. These include the distribution of children by several attributes: sex, area, degree of urbanisation, macroregion, age in months, mother's (or caregiver's) education, respondent type, functional difficulties (for children under age 5 only for age 2-4 years), mother's functional difficulties, and wealth index quintiles.

[42] Throughout this report when used as a background variable, unless otherwise stated, "education" refers to highest educational level ever attended by the respondent.

[43] The wealth index is a composite indicator of wealth. To construct the wealth index, principal components analysis is performed by using information on the ownership of consumer goods, dwelling characteristics, water and sanitation, and other characteristics that are related to the household's wealth, to generate weights (factor scores) for each of the items used. First, initial factor scores are calculated for the total sample. Then, separate factor scores are calculated for households in urban and rural areas. Finally, the urban and rural factor scores are regressed on the initial factor scores to obtain the combined, final factor scores for the total sample. This is carried out to minimise the urban bias in the wealth index values. Each household in the total sample is then assigned a wealth score based on the assets owned by that household and on the final factor scores obtained as described above. The survey household population is then ranked according to the wealth score of the household they are living in, divided into 10 equal parts (deciles), and then finally regrouped into 5 equal parts (quintiles) from lowest (poorest) to highest (richest). In 2025-26 Ukraine MICS, the following assets were used in these calculations: material of floor, material of roof, material of walls, fixed telephone line, radio, mechanical meat grinder, hand sewing machine, table, cabinet for clothes or bookcases, sofa or bed or armchair, broom or mechanical mop, garden tool, connection to electricity grid, refrigerator, air conditioner, microwave, dishwasher, robot vacuum cleaner, diesel or gasoline generator, rechargeable battery, smart home system, TV with a kinescope, flat screen TV, satellite dish, washing machine, wristwatch, bicycle, motorcycle or moped or scooter, animal-drawn cart, car or truck or minivan or van, boat with a motor, stand-up electric scooter, tractor or combine and other agricultural machinery, computer/desktop/tablet, mobile telephone, smartphone, internet at home, possession of agricultural land, bank account, type of cookstove, type of space heating, type of energy for lighting, main source of drinking water, sanitation facility, shared facility, availability of water in the place for handwashing, availability of bar or liquid soap, availability bath or shower in dwelling, yard, or plot. The wealth index is assumed to capture the underlying long-term wealth through information on the household assets and is intended to produce a ranking of households by wealth, from poorest to richest. The wealth index does not provide information on absolute poverty, current income or expenditure levels. The wealth scores calculated are applicable for only the particular data set they are based on. Further information on the construction of the wealth index can be found in:

Filmer, D., and L. Pritchett. "Estimating Wealth Effects without Expenditure Data — or Tears: An Application to Educational Enrollments in States of India*." Demography 38, no. 1 (2001): 115-32. doi:10.1353/dem.2001.0003.;

Rutstein, S., and K. Johnson. The DHS Wealth Index. DHS Comparative Reports No. 6. Calverton: ORC Macro, 2004. https://dhsprogram.com/pubs/pdf/CR6/CR6.pdf.;

Rutstein, S. The DHS Wealth Index: Approaches for Rural and Urban Areas. Calverton: Macro International, 2008. https://dhsprogram.com/pubs/pdf/WP60/WP60.pdf.

[44] When describing survey results by wealth quintiles, appropriate terminology is used when referring to individual household members, such as for instance "women in the richest population quintile", which is used interchangeably with "women in the wealthiest survey population", "women living in households in the richest population wealth quintile", and similar.

Table SR.5.1W: Women's background characteristics

Percent and frequency distribution of women age 15-49 years, Ukraine MICS, 2025-26

Richest	28.7	881	798

[A] In this table and throughout the report where applicable, mother's education refers to educational attainment of the respondent.

[B] Only if the child's mother was not listed as member of the household (i.e., deceased or is living elsewhere) a primary caregiver was identified as respondent.

[C] The results of the Child Functioning module are presented in Chapter 11.1.

[D] Children age 0-1 years are excluded, as functional difficulties are only collected for age 2-4 years.

[E] In this table and throughout the report, mother's functional difficulties refer to functional difficulty of the respondent as described in note B. The category of "No information" applies to mothers or caregivers to whom the Adult Functioning module was not administered. This category is not presented in individual tables. Please refer to Table SR.8.1W_SS for results of the Adult Functioning module.

Table SR.5.3: Children age 5-17 years' background characteristics

Percent and frequency distribution of children age 5-17 years, Ukraine MICS, 2025-26

Richest	25.7	1291	1014	927

[A] As one child is randomly selected in each household with at least one child age 5-17 years, the final weight of each child is the weight of the household multiplied with the number of children age 5-17 years in the household. This column is the basis for the weighted percent distribution, i.e. the distribution of all children age 5-17 years in sampled households.

[B] In this table and throughout the report where applicable, mother's education refers to educational attainment of the respondent.

[C] Children age 15-17 years were considered emancipated and individually interviewed if not living with their mother and the respondent to the Household Questionnaire indicated that the child does not have a primary caregiver. This category is not presented in individual tables.

[D] Only if the child's mother was not listed as member of the household (i.e., deceased or is living elsewhere) a primary caregiver was identified as respondent. The category of "Emancipated" applies to children age 15-17 years as described in note C.

[E] The results of the Child Functioning module are presented in Chapter 11.1.

[F] In this table and throughout the report, mother's functional difficulties refer to functional difficulty of the respondent as described in note D. The category of "No information" applies to mothers or caregivers to whom the Adult Functioning module was not administered. Emancipated children are also included in this category. This category is not presented in individual tables. Please refer to Table SR.8.1W_SS for results of the Adult Functioning module.

4.6 Household energy use

There is a global consensus and an ever-growing body of evidence that expanding access to clean household energy for cooking, heating, and lighting is key to achieving a range of global priorities such as improving health, gender equality, equitable economic development and environmental protection. Goal 7 of the SDGs seeks to ensure access to affordable, reliable sustainable and modern energy for all by 2030 and would be measured as the percentage of the population relying on clean fuels and technology.[45]

The 2025-26 Ukraine MICS included a module with questions to assess the main technologies and fuels used for cooking, heating, and lighting.

Households that use clean fuels and technologies for cooking are those mainly using electric stove, piped natural gas stove or LPG (Liquefied Petroleum Gas)/cooking gas stove. Table SR.6.1 presents the percent distribution of household members according to type of cookstove mainly used by the household and percentage of household members living in households using clean fuels and technologies for cooking.

Table SR.6.2 further presents the percent distribution of household members using polluting fuels and technologies for cooking according to type of cooking fuel mainly used by the household, and percentage of household members living in households using polluting fuels and technologies for cooking.

Households that use clean fuels and technologies for space heating are those mainly relying on central heating, electricity (including solar air heater), piped natural gas or LPG/cooking gas. Table SR.6.3 presents the percent distribution of household members according to type of fuel mainly used for space heating by the household, and percentage of household members living in households using clean fuels and technologies for space heating.

Households that use clean fuels and technologies for lighting are those mainly using electricity (including solar panels), solar-powered lantern or flashlight, rechargeable or battery powered flashlight, torch or lantern. Table SR.6.4 presents the percent distribution of household members according to type of lighting fuel mainly used for lighting by the household, and percentage of household members living in households using clean fuels and technologies for lighting.

The questions asked about cooking, space heating and lighting help to monitor SDG indicator 7.1.2, "Proportion of population with primary reliance on clean fuels and technology" for cooking, space heating and lighting. Table SR.6.5 presents the percentage of household members living in households using clean fuels and technologies simultaneously for cooking, space heating, and lighting.

[1] MICS indicator SR.604 - Primary reliance on clean fuels and technologies for cooking, space heating, and lighting; SDG Indicator 7.1.2

[A] For households that do not use space heating, the computation is based on reliance on clean fuel use for cooking and lighting. Similar approach is applied for households that report no cooking or do not use lighting.

( ) Figures that are based on 25–49 unweighted cases

4.7 Migration, place of birth and citizenship

The Migration module of the 2025-26 Ukraine MICS asked respondents to the Questionnaire for Women Age 15-49 how long they have been continuously living in the current residence and, if they were not living there since birth, whether they lived in a city, or rural area and the name of the region they lived in before moving to their current place of residence. Table SR.7.1W presents the percentage of woman age 15-49 years who have changed residence according to the time since last move and also compares the place of residence of each woman at the time of the survey with that of the last place of residence and the type of area of residence.

The Background module of the Questionnaire for Women Age 15-49 asked about the place of birth and the citizenship of the respondents. Table SR.7.2W presents the percent distribution of place of birth among women age 15-49 years . The percent distribution of country of birth among women born outside Ukraine is not shown in the table due to the low number of foreign born women (33 unweighted cases). While Table SR.7.3W presents percent distribution of women age 15-49 years by citizenship, the percentage of country of citizenship among women who are citizens of another country is not shown in the table due to the low number of women who are citizens of another country (18 unweighted cases).

Table SR.7.1W_SS: Most recent migration (women age 15-49 years)

Percent distribution of women age 15-49 years by most recent migration and years since last migration, and percentage of women who migrated, by place of last residence, Ukraine MICS, 2025-26

	Years since most recent migration					Total	Number of women	Most recent migration was from:								Number of women who ever migrated
								Type of area					Nation			
	Never migrated	Within 5 years	5-9 years	10 years or more	Missing			City	Rural area	Unable to determine whether city / rural area	DK	Missing	Within Ukraine	Outside Ukraine	Missing

4.8 Adult functioning

The Adult Functioning module is based on the enhanced "short set" of questions developed by the Washington Group on Disability Statistics (WG) – a UN City Group established under the United Nations Statistical Commission. These questions reflect nine domains for measuring disability: seeing, hearing, walking, cognition, self-care, communication, upper body activities, anxiety, and depression. The first six domains constitute the short set (WG-SS), whereas the full list of nine domains is the enhanced short set (WG-SS Enhanced). This module is recommended for disaggregation of SDG indicators for adults.[46]

The MICS7 standard questionnaires include the questions of the enhanced short set in the individual questionnaire as specified previously. For women age 18-49, data are obtained directly from the respondents themselves.[47]

Information at the individual level can also be obtained through a proxy respondent using a roster approach of these questions in the household questionnaire. This would necessitate a single proxy respondent answering on behalf of all adult household members. A proxy respondent can identify a large proportion of difficulties, but tend to under-identify persons with functional difficulties, either deliberately or inadvertently.

Self-reporting too can have methodological issues. Specifically, a self-reported approach can bias the total sample, as some individuals cannot be interviewed due to their disability (labelled as "incapacitated" in the result code of the individual questionnaires by the interviewers). The number of "incapacitated" individuals identified in household surveys is generally very low (usually around 0.5%) and holds both those incapacitated for reasons of disability and those incapacitated for any reason (e.g., sick in bed).

Regardless, to avoid such potential bias, the Adult Functioning data in MICS should not be used to estimate prevalence in the household population age 18-49 years. The standard tabulations of MICS do therefore not include such. These data are however the recommended methodology to allow countries to disaggregate the SDG indicators by disability status – the objective behind the inclusion of the module. It is important to interpret the disaggregate with the bias in mind: The data is representative for the household population age 18-49 for which an interview was completed and functioning difficulty is sometimes the reason for incomplete questionnaires.

The recommendation of the WG is to use a proxy respondent for those individuals who cannot respond for themselves, as this would allow estimation of prevalence in the household population age 18-49 years. This approach is not currently sought by MICS, as the majority of data captured in individual questionnaires cannot be collected through a proxy respondent (e.g., the SDG indicators on fertility, child mortality, family planning, delivery attendance, maternal mortality, early marriage, etc.).

Tables SR.8.1W presents the percentage of woman age 18-49 years with functional difficulties, by domain, and percentage who use assistive devices. For the purpose of comparison, both the WG-SS and the Enhanced WG-SS are presented as many surveys utilise only the WG-SS. The Enhanced WG-SS is used for disaggregation in other results tables.

[46] IAEG-SDG's. Disability Data Disaggregation. Joint Statement by the Disability Sector, Geneva, 2016. https://www.internationaldisabilityalliance.org/sites/default/files/documents/joint_statement_on_disaggregation_of_data_by_disability_final.pdf.

[47] Note that the Adult Functioning module does not cover adults over age 49 years which is the population most at risk of having a functional limitation due to aging.

Table SR.8.1W_SS: Adult functioning (women age 18-49 years)

[A] In MICS, the adult functioning module is asked to individual respondents age 18-49 for the purpose of disaggregation. No information is collected on eligible respondents who, for any reason, were unable to complete the interview. Generally, in MICS, it is expected that a significant proportion of the cases of eligible respondents for whom the response code "Incapacitated" was indicated for the individual interview are indeed incapacitated due to functional difficulties. Therefore, the percentage of respondents with functional difficulties presented here is usually not representing a full measure and should not be used for reporting on prevalence in the population. However, in Ukraine such cases of "incapacitated" were not recorded, and the presented here can therefore be used as prevalence for the household population of women age 18-49 years. Refer to the accompanying text for further information on the Washington Group Short Set on Functioning (WG-SS) and its Enhanced version (WG-SS Enhanced).

4.9 Children's living arrangements

The Convention on the Rights of the Child (CRC) recognises that "the child, for the full and harmonious development of his or her personality, should grow up in a family environment, in an atmosphere of happiness, love and understanding".[48] Millions of children around the world grow up without the care of their parents for several reasons, including due to the premature death of the parents or their migration for work. In most cases, these children are cared for by members of their extended families, while in others, children may be living in households other than their own, as live-in domestic workers for instance. Understanding the children's living arrangements, including the composition of the households in which they live and the relationships with their primary caregivers, is key to design targeted interventions aimed at promoting child's care and wellbeing.

Table SR.9.1 presents information on the living arrangements and orphanhood status of children under age 18.

The 2025-26 Ukraine MICS included a simple measure of one particular aspect of migration related to what is termed "children left behind", i.e., for whom one or both parents have moved abroad. While the amount of literature is growing, the long-term effects of the benefits of remittances versus the potential adverse psycho-social effects are not yet conclusive, as there is somewhat conflicting evidence available as to the effects on children. Table SR.9.2 presents information on the living arrangements and co-residence with parents of children under age 18.

Table SR.9.3 presents information on children under age 18 years not living with a biological parent according to relationship to the head of household and those living in households headed by a family member.

[48] Convention on the rights of the child (1989) Treaty no. 27531. United Nations Treaty Series, 1577, preamble. Accessed 7 July 2025. https://www.unicef.org/child-rights-convention/convention-text.

„–" Denotes 0 unweighted cases in the denominator

5. Survive

With the SDG target (3.2) for child mortality, on ending preventable deaths of newborns and children under 5 years of age, the international community has retained the overarching goal of reducing child mortality. While the global target calls for reducing neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to at least as low as 25 deaths per 1,000 live births, reduction of child mortality continues to be one of the most important objectives in national plans and programmes in each and every country.

Mortality rates presented in this chapter are calculated from information collected in the birth histories of the Women's Questionnaires. All interviewed women were asked whether they had ever given birth, and those who had were asked to report the number of sons and daughters who live with them, the number who live elsewhere, and the number who have died. In addition, women were asked to provide detailed information on their live births, starting with the firstborn, in chronological order. This information included whether births were single or multiple, and for each live birth, sex, date of birth (month and year), and survival status. Further, for children alive at the time of survey, women were asked the current age of the child; for deceased children, the age at death was obtained. Childhood mortality rates are expressed by conventional age categories and are defined as follows:

- Neonatal mortality (NN): probability of dying within the first month of life[49]
- Post-neonatal mortality (PNN): difference between infant and neonatal mortality rates
- Infant mortality (1q0): probability of dying between birth and the first birthday
- Child mortality (4q1): probability of dying between the first and the fifth birthdays
- Under-five mortality (5q0): the probability of dying between birth and the fifth birthday

Neonatal, infant and under-five mortality rates are expressed as deaths per 1,000 live births. Child mortality is expressed as deaths per 1,000 children surviving to age one. Post-neonatal mortality is calculated as the difference between infant and neonatal mortality rates.

Table CS.1 presents neonatal, post-neonatal, infant, child, and under-five mortality rates for the three most recent five-year periods before the survey. For each mortality rate in the table, it is possible to assess changes over time, during the last 15 years preceding the survey.

Tables CS.2 and CS.3 provide estimates of child mortality by socioeconomic and demographic characteristics. Using the rates calculated for the 5-year period immediately preceding the survey, differentials in mortality rates by socioeconomic characteristics, such as macroregion, mother's education and wealth, and by demographic characteristics such as sex and mother's age at birth are presented.

Table CS.1: Early childhood mortality rates

Neonatal, post-neonatal, infant, child and under-five mortality rates for five year periods preceding the survey, Ukraine MICS, 2025-26

	Neonatal mortality rate[1]	Post-neonatal mortality rate[2,A]	Infant mortality rate[3]	Child mortality rate[4]	Under-five mortality rate[5]

6. Thrive – Reproductive, maternal, newborn, and adult health

6.1 Fertility

Measures of current fertility are presented in Table TM.1.1 for the three-year period preceding the survey. A three-year period was chosen for calculating these rates to provide the most current information, while also allowing the rates to be calculated for a sufficient number of cases so as not to compromise the statistical precision of the estimates. The current fertility measures, presented in the table by urban and rural residence, are as follows:

- Age-specific fertility rates (ASFRs), expressed as the number of births per 1,000 women in a specified age group, show the age pattern of fertility. Numerators for ASFRs are calculated by identifying live births that occurred in the three-year period preceding the survey, classified according to the age of the mother (in five-year age groups) at the time of the child's birth. Denominators of the rates represent the number of woman-years lived by all interviewed women (or in simplified terms, the average number of women) in each of the five-year age groups during the specified period.
- The ASFRs for adolescents, that is, for age 10-14 and 15-19 years, are known as the adolescent birth rates. The rates for the age group 10-14 are based on retrospective data from girls age 15-17 years, as the age eligibility for the questionnaire begins at age 15.
- The total fertility rate (TFR) is a synthetic measure that denotes the number of live births a woman would have if she were subject to the current age-specific fertility rates throughout her reproductive years (15-49 years).
- The general fertility rate (GFR) is the number of live births occurring during the specified period per 1,000 women age 15-49.
- The crude birth rate (CBR) is the number of live births per 1,000 household population during the specified period.

Table TM.1.1: Fertility rates

Adolescent birth rates, age-specific and total fertility rates, the general fertility rate, and the crude birth rate for the three-year period preceding the survey, by area of residence, Ukraine MICS, 2025-26

	Area		Total
	Urban	Rural	
Age[A]

45-49	0	1	0
TFR (15-49 years)[C]	**0.9**	**1.5**	**1.1**
GFR (15-49 years)[D]	**27**	**39**	**31**
CBR[E]	**5**	**6**	**5**

[1] MICS indicator TM.1a - Adolescent birth rate (age 10-14 years); SDG indicator 3.7.2

[2] MICS indicator TM.1b - Adolescent birth rate (age 15-19 years); SDG indicator 3.7.2

[A] The age-specific fertility rates (ASFR) are the number of live births in the last 3 years, divided by the average number of women in that age group during the same period, expressed per 1,000 women. The age-specific fertility rates for girls age 10-14 and 15-19 years are also termed the adolescent birth rates

[B] The rates for the age group 10-14 are based on retrospective data from girls age 15-17 years

[C] TFR: The Total Fertility Rate is the sum of age-specific fertility rates of women age 15-49 years. The TFR denotes the average number of children to which a woman will have given birth by the end of her reproductive years (by age 50) if current fertility rates prevailed. The rate is expressed per woman age 15-49 years

[D] GFR: The General Fertility Rate is the number of births in the last 3 years divided by the average number of women age 15-49 years during the same period, expressed per 1,000 women age 15-49 years

[E] CBR: The Crude Birth Rate is the number of births in the last 3 years, divided by the total population during the same period, expressed per 1,000 population

6.2 Early childbearing

Table TM.2.1 presents the survey findings on adolescent birth rates and further disaggregates of the total fertility rate. The adolescent birth rate (age-specific fertility rate for women age 15-19) is defined as the number of births to women age 15-19 years during the three-year period preceding the survey, divided by the average number of women age 15-19 (number of women-years lived between ages 15 through 19, inclusive) during the same period, expressed per 1,000 women.[50] The adolescent birth rate is a Global SDG indicator (3.7.2) for ensuring universal access to sexual and reproductive health-care services (Target 3.7).

Table TM.2.1: Adolescent birth rate and total fertility rate

Adolescent birth rates and total fertility rates for the three-year period preceding the survey, Ukraine MICS, 2025-26

[1] MICS indicator TM.1b - Adolescent birth rate (age 15-19 years); SDG indicator 3.7.2

[A] Please see Table TM.1.1 for definitions.

na: not applicable

( ) A rate in parenthesis is based on 125 to 249 unweighted woman-years of exposure

(*) An asterisk denotes that the rate is based on less than 125 woman-years of exposure

[50] The adolescent birth rate for girls age 10-14 years is computed in table TM.1.1. Due to the extremely small number of births in this age group, the estimate is not disaggregated further. The rate for girls age 10-14 is based on retrospective data from girls age 15-17 years.

Tables TM.2.2W presents a selection of early childbearing indicators for young women age 15-19 and 20-24 years. In Table TM.2.2W, percentages among women age 15-19 who have had a live birth and those who are pregnant with their first child are presented. For the same age group, the table also presents the percentage of women who have had a live birth before age 15. These estimates are all derived from the detailed birth histories of women. To estimate the proportion of women who have had a live birth before age 18 – when they were still children themselves – data based on women age 20-24 years at the time of survey are used to avoid truncation.[51]

Table TM.2.2W: Early childbearing (young women)

Percentage of women age 15-19 years who have had a live birth, are pregnant with the first child, have had a live birth or are pregnant with first child, and who have had a live birth before age 15, and percentage of women age 20-24 years who have had a live birth before age 18, Ukraine MICS, 2025-26

	Percentage of women age 15-19 years who:				Number of women age 15-19 years	Percentage of women age 20-24 years who have had a live birth before age 18[1]	Number of women age 20-24 years
	Have had a live birth	Are pregnant with first child	Have had a live birth or are pregnant with first child	Have had a live birth before age 15

[1] MICS indicator TM.2 - Early childbearing

( ) Figures that are based on 25–49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

[51] Using women age 15-19 to estimate the percentage who had given birth before age 18 would introduce truncation to the estimates, since the majority of women in this age group will not have completed age 18 and therefore will not have completed exposure to childbearing before age 18. The age group 20-24 is used to estimate the percentage of women giving birth before age 18, since all women in this age group have completed exposure to childbearing at early ages.

Tables TM.2.3W looks at trends in early childbearing for women, by presenting percentages of women who became mothers before ages 15 and 18, for successive age cohorts. The table is designed to capture trends in urban and rural areas separately.

Table TM.2.3W: Trends in early childbearing (women)

Percentage of women who have had a live birth, by age 15 and 18, by area of residence, Ukraine MICS, 2025-26

	Urban				Rural				All

6.3 Contraceptive use

Appropriate contraceptive use is important to the health of women and children by:

1. preventing pregnancies that are too early or too late,
2. extending the period between births, and
3. limiting the total number of children.[52]

Table TM.3.0A presents awareness of specific contraceptive methods among all women aged 15–49, women currently married or in union, and sexually active woman currently unmarried or not in union. Table TM.3.0B presents awareness of contraceptive methods among women who are currently married or in union, including awareness of at least one contraceptive method, at least one modern method, and at least one traditional method.

Table TM.3.1 presents the current use of contraception for women who are currently married or in union while Table TM.3.2 presents the same information for women who are not currently married or in union and are sexually active. In Table TM.3.1, use of specific methods of contraception are first presented; specific methods are then grouped into modern and traditional methods and presented as such. For sexually active women who are not currently married or in union, in Table TM.3.2, contraceptive use is only presented by modern and traditional method categories.

Table TM.3.0A_SS: Knowledge of specific contraceptive methods

Percentage of all women age 15-49 years, percentage of women currently married or in union, and percentage sexually active[A] women currently unmarried or not in union who have heard of any contraceptive method, by specific method, Ukraine MICS, 2025-26

[A] "Sexually active" is defined as having had sex within the last 30 days.

[B] The sum of "Any modern method" and "Any traditional method" may not equal "Any method" due to 2 unweighted cases where current contraceptive use was reported, but the method was not specified.

( ) Figures that are based on 25–49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

6.4 Need and demand for family planning

Percentage of demand for family planning satisfied with modern methods is one of the indicators used to track progress toward the Sustainable Development Goal, Target 3.7, on ensuring universal access to sexual and reproductive health-care services, including for family planning, information and education and the integration of reproductive health into national strategies and programmes.

Unmet need for contraception refers to fecund women who are not using any method of contraception, but who wish to postpone the next birth (spacing) or who wish to stop childbearing altogether (limiting). Unmet need is identified in MICS by using a set of questions eliciting current behaviours and preferences pertaining to contraceptive use, fecundity, and fertility preferences.

Table TM.4.1 shows the levels of unmet need and met need for contraception, and the demand for contraception satisfied for women who are currently married or in union. The same tabulations are produced in Table TM.4.2 for sexually active women who are not currently married or in union, and finally, Table.TM.4.3 shows the information for all women and therefore holds SDG Indicator 3.7.1 - Need for family planning satisfied with modern contraception (among all women).

Unmet need for spacing is defined as the percentage of women who are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrhoeic[53] and iii) fecund[54] and say they want to wait two or more years for their next birth OR
- are i) not pregnant, ii) not post-partum amenorrhoeic, and iii) fecund and unsure whether they want another child OR
- are pregnant, and say that pregnancy was mistimed (would have wanted to wait) OR
- are post-partum amenorrhoeic and say that the birth was mistimed (would have wanted to wait).

Unmet need for limiting is defined as percentage of women who are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrhoeic, and iii) fecund and say they do not want any more children OR
- are pregnant and say they did not want to have a child OR
- are post-partum amenorrhoeic and say that they did not want the birth.

Total unmet need for contraception is the sum of unmet need for spacing and unmet need for limiting.

Met need for limiting includes women who are using (or whose partner is using) a contraceptive method[55] and who want no more children, are using male or female sterilisation, or declare themselves as infecund. Met need for spacing includes women who are using (or whose partner is using) a contraceptive method and who want to have another child or are undecided whether to have another child. Summing the met need for spacing and limiting results in the total met need for contraception.

Using information on contraception and unmet need, the percentage of demand for contraception satisfied is also estimated from the MICS data. The percentage of demand satisfied is defined as the proportion of women who are currently using contraception over the total demand for contraception. The total demand for contraception includes women who currently have an unmet need (for spacing or limiting) plus those who are currently using contraception.

[53] A woman is post-partum amenorrhoeic if she had a live birth in last two years and is not currently pregnant, and her menstrual period has not returned since the birth of the last child.

[54] A woman is considered infecund if she is neither pregnant nor post-partum amenorrhoeic, and

(1a) has not had menstruation for at least six months, or (1b) has never menstruated, or (1c) had last menstruation occurring before her last birth, or (1d) is in menopause/has had hysterectomy OR

(2) she declares that she i) has had hysterectomy, ii) has never menstruated, iii) is menopausal or iv) has been trying to get pregnant for at least 2 years without result in response to questions on why she thinks she is not physically able to get pregnant at the time of survey OR

(3) she declares she cannot get pregnant when asked about desire for future birth OR

(4) she has not had a birth in the preceding 5 years, is currently not using contraception and is currently married and was continuously married during the last 5 years preceding the survey.

[55] In this chapter, whenever reference is made to the use of a contraceptive by a woman, this includes her partner using a contraceptive method (such as male condom).

Table TM.4.1: Need and demand for family planning (currently married/in union)

Percentage of women age 15-49 years who are currently married or in union with unmet and met need for family planning, total demand for family planning, and, among women with need for family planning, percentage of demand satisfied by method of contraception, Ukraine MICS, 2025-26

6.5 Antenatal care

The antenatal period presents important opportunities for reaching pregnant women with a number of interventions that may be vital to their health and well-being and that of their infants. For example, antenatal care can be used to inform women and families about risks and symptoms in pregnancy and about the risks of labour and delivery, and therefore it may provide the route for ensuring that pregnant women do, in practice, deliver with the assistance of a skilled health care provider. Antenatal visits also provide an opportunity to supply information on birth spacing, which is recognised as a key factor in improving infant survival.

World Health Organization (WHO) recommends a minimum of eight antenatal visits based on a review of the effectiveness of different models of antenatal care.[56] WHO guidelines are specific on the content on antenatal care visits, which include:

- Blood pressure measurement
- Urine testing for bacteriuria and proteinuria
- Blood testing to detect syphilis and severe anaemia
- Weight/height measurement (optional)

It is of crucial importance for pregnant women to start attending antenatal care visits as early in pregnancy as possible and ideally have the first visit during the first trimester to prevent and detect pregnancy conditions that could affect both the woman and her baby. Antenatal care should continue throughout the entire pregnancy.[56]

Antenatal care is a tracer indicator of the Reproductive and Maternal Health Dimension of SDG 3.8 Universal Health Coverage.

The type of personnel providing antenatal care to women age 15-49 years who gave birth in the two years preceding is presented in Table TM.5.1.

Table TM.5.2 shows the number of antenatal care visits during the pregnancy of their most recent birth within the two years preceding the survey, regardless of provider, by selected characteristics. Table TM.5.2 also provides information about the timing of the first antenatal care visit.

The coverage of key services that pregnant women are expected to receive during antenatal care are shown in Table TM.5.3.

6.6 Delivery care

Increasing the proportion of births that are delivered in health facilities is a key factor in reducing the health risks to both the mother and the baby. Proper medical attention and hygienic conditions during delivery can reduce the risks of complications and infection that can cause morbidity and mortality to either the mother or the baby.[57]

Table TM.6.1 presents the percent distribution of women age 15-49 who had a live birth in the two years preceding the survey by place of delivery of the most recent birth, and the percentage of their most recent births delivered in a health facility, according to background characteristics.

About three quarters of all maternal deaths occur due to direct obstetric causes.[58] The single most critical intervention for safe motherhood is to ensure that a competent health worker with midwifery skills is present at every birth, and, in case of emergency, that there is a referral system in place to provide obstetric care in the right level of facility.[57] The skilled attendant at delivery indicator is used to track progress toward the Sustainable Development Goal 3.1 of reducing maternal mortality and it is SDG indicator 3.1.2.

The MICS included questions to assess the proportion of births attended by a skilled attendant. According to the revised definition[57], skilled health personnel, as referenced by SDG indicator 3.1.2, are competent maternal and newborn health professionals educated, trained and regulated to national and international standards. They are competent to facilitate physiological processes during labour to ensure clean and safe birth and identify and manage or refer women and/or newborns with complications. In Ukraine, almost all births occur with the assistance of a qualified specialist - obstetrician-gynecologist

Table TM.6.2 presents information on assistance during delivery of the most recent birth in the two years preceding the survey. Table TM.6.2 also shows information on women who delivered by caesarean section (C-section) and provides additional information on the timing of the decision to conduct a C-section (before labour pains began or after) to better assess if such decisions are mostly driven by medical or non–medical reasons.

6.8 Postnatal care

The time of birth and immediately after is a critical window of opportunity to deliver lifesaving interventions for both the mother and newborn. Across the world, approximately 2.3 million newborns annually die in the first month of life.[59] The majority of newborn deaths occur within the first few days of life, with approximately 45% of early neonatal mortality happening within 24 hours after birth, and 19% occurring on the second day,[60] which is also the time when the majority of maternal deaths occur, due to complications such as postpartum haemorrhage and hypertensive disorders.[61]

The Postnatal Health Checks module includes information on newborns' and mothers' contact with a provider, and specific questions on content of care. Measuring contact alone is important as postnatal care (PNC) programmes scale up, it is vital to measure the coverage of that scale up and ensure that the platform for providing essential services is in place. In Ukraine, postnatal care programs include free medical care for the mother and newborn under the Medical Guarantees Program. Postnatal care is free in medical facilities that have a contract with the National Health Service of Ukraine (NHSU). Safe motherhood programmes recommend that all women and newborns receive a health check within two days of delivery.[62] To assess the extent of postnatal care utilisation, women were asked whether they and their newborn received a health check after the delivery, the timing of the first check, and the type of health provider for the woman's most recent birth in the two years preceding the survey.

Essential components of the content of postnatal care include, but are not limited to, thermal and cord care, breastfeeding counselling, assessing the baby's temperature, weighing the baby, and counselling the mother on danger signs for newborns. Thermal care and cord care are essential elements of newborn care which contributes to keeping the baby stable and preventing hypothermia. Appropriate cord care is important for preventing life-threatening infections for both mother and baby.[57] Proper hygiene practices and timely interventions can significantly reduce neonatal sepsis and maternal infections, which are major contributors to mortality in the postnatal period.

Table TM.8.6 presents indicators related to the content of PNC visits, specifically the percent of most recent live births in the last two years for which, within 2 days after birth, i) the umbilical cord was examined, ii) the temperature of the newborn was assessed, iii) breastfeeding counselling was done or breastfeeding observed, iv) the newborn was weighed and v) counselling on danger signs for newborns was done.

Table TM.8.6: Content of postnatal care for newborns

Percentage of women age 15-49 years with a live birth in the last 2 years for whom, within 2 days of the most recent live birth, the umbilical cord was examined, the temperature of the newborn was assessed, breastfeeding counselling was done or breastfeeding observed, the newborn was weighed and counselling on danger signs for newborns was done, Ukraine MICS, 2025-26

6.10 Tobacco use

Tobacco products are products made entirely or partly of leaf tobacco as raw material, which are intended to be smoked, sucked, chewed, or snuffed. All contain the highly addictive psychoactive ingredient, nicotine. Tobacco use is one of the main risk factors for a number of chronic diseases, including cancer, lung diseases, and cardiovascular diseases.[63] If mentioned, e-cigarettes are included in the other response category of smokeless tobacco product use.

The 2025-26 Ukraine MICS collected information on ever and current use of cigarettes and the intensity of use among the respondents age 15-49 years. To capture the prevalence of current tobacco users, information was also gathered on use of electronic cigarettes, other smoked, and smokeless tobacco. The questionnaire was adapted to capture heated tobacco devices alongside electronic cigarettes and vaping devices. The questionnaire was not designed to capture prevalence of users of each individual type of tobacco use, only the total, as defined by SDG Indicator 3.8.1.

Table TM.10.1W presents the percentage of women age 15-49 years who smoked a whole cigarette before age 15 and percent distribution of current cigarette smokers by the average number of cigarettes smoked each day. Table TM.10.2W presents the percentage of women age 15-49 years who are current cigarette smokers, percentage who are not current cigarette users but are current users electronic cigarettes, heated tobacco devices such as IQOS or other vaping devices, percentage who are not current cigarette or electronic cigarette users, but are users of another smoked tobacco product, and percentage who are not users of any smoked tobacco product but are current users of smokeless tobacco. The sum of these individual columns leads to the total percentage who are current tobacco users.

Table TM.10.1W_SS: Cigarette smoking

Percentage of women age 15-49 years who smoked a whole cigarette before age 15, percentage who smoked at least one cigarette in the last one month, and percent distribution of current cigarette smokers by the average number of cigarettes smoked each day, Ukraine MICS, 2025-26

7.2 HPV immunisation

The priority purpose of HPV (human papillomavirus vaccine) immunisation is the prevention of cervical cancer, which accounts for the majority of all HPV-related cancers. WHO recommends that HPV vaccines should be included in all national immunisation programmes and should reach 90% of all girls by age 15 by 2030. Prevention of cervical cancer is best achieved through the immunisation of girls before they become sexually active, that is, in the target age group of age 9-14 years, as early as possible.[64]

In Ukraine, HPV vaccination was not part of the mandatory immunization program until the end of 2025. Vaccination was only recommended. For girls aged 9-13, the decision on HPV vaccination was made by their parents. Vaccination consisted of two doses administered at intervals of 5-13 months, depending on the type of vaccine. However, as of January 1, 2026, the National Immunization Schedule was updated in accordance with European standards. Currently, HPV vaccination is administered to girls aged 12 through 13 full years, with a single dose of the Gardasil 9 vaccine. Girls living with HIV and children who have been victims of sexual abuse receive the HPV vaccine as early as possible, starting at age 9. Vaccination of girls living with HIV or with primary immunodeficiency is administered using a 3-dose vaccination schedule.[65]

Information on vaccination coverage was collected for all adolescent girls age 15-17 years and details are presented in Table TC.2.1. At the global level, SDG indicator 3.b.1 is used to monitor the progress of the vaccination of children at the national level. The indicator is specifically measured on girls age 15 only, whereas Table TC.2.1 reports on all girls age 15-17 years.

Since adolescent girls aged 15-17 years could have been vaccinated according to the previous recommendations, which required two doses, the SDG indicator 3.b.1 is reported based on completion of the two-dose HPV vaccination series. The new recommendation for a single-dose vaccination schedule, introduced on January 1, 2026, applies only to younger girls aged 12-13 years. Therefore, none or only a small proportion of adolescent girls in the target age group would be expected to have completed HPV vaccination according to the new single-dose schedule.

7.3 Disease episodes

A key strategy for achieving progress toward SDG 3.2: By 2030, end preventable deaths of newborns and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1,000 live births and under-5 mortality to at least as low as 25 per 1,000 live births, is to tackle the diseases such as diarrhoea, pneumonia, and malaria which are still among the leading killers of children under 5.[66] Target 3.3 of the SDGs on ending the epidemics on malaria by 2030 along with other diseases is interpreted as the attainment of the Global Technical Strategy for malaria 2016-2030 and the Roll Back Malaria advocacy plan, Action and Investment to defeat Malaria 2016-2030 targets which aim at reducing malaria mortality rates globally by 90 percent compared with 2015. Ukraine is officially recognized as a country where malaria never existed or disappeared without specific measures by the World Health Organization (WHO).

Table TC.3.1 presents the percentage of children under 5 years of age who were reported to have had symptoms of acute respiratory infection (ARI), during the 2 weeks preceding the survey. These results are not measures of true prevalence, and should not be used as such, but rather the period-prevalence of those illnesses over a two-week time window.

A child was considered to have had symptoms of ARI if the mother or caregiver reported that the child had, over the specified period, an illness with symptoms of rapid or difficult breathing perceived to be due to a problem in the chest or both a problem in the chest and a blocked or runny nose.[67] While this approach is reasonable in the context of a multi-topic household survey, these basically simple case definitions must be kept in mind when interpreting the results, as well as the potential for reporting and recall biases. Further, ARI is not only seasonal but are also characterised by the often rapid spread of localised outbreaks from one area to another at different points in time. The timing of the survey and the location of the teams might thus considerably affect the results, which must consequently be interpreted with caution. For these reasons, although the period-prevalence over a two-week time window is reported, these data should not be used to assess the epidemiological characteristics of these diseases but rather to obtain denominators for the indicators related to use of health services and treatment.

[66] The main killers of children under age 5 in 2021 included preterm birth complications (18%), pneumonia (14%), intrapartum related events (12%), diarrhoea (9%), and malaria (9%). United Nations Inter-agency Group for Child Mortality Estimation (UNIGME). Levels & Trends in Child Mortality: Report 2023. New York: UNICEF, 2024. https://data.unicef.org/wp-content/uploads/2024/04/UN-IGME-2023-Child-Mortality-Report.pdf

[67] This definition is different to what has been used in the past. Before MICS7, symptoms of ARI also required a cough.

7.5 Symptoms of acute respiratory infection

Symptoms of ARI are collected during the 2025-26 Ukraine MICS to capture symptoms related to pneumonia, a leading cause of death in children under five.[66] Once diagnosed, pneumonia is treated effectively with antibiotics. Studies have shown a limitation in the survey approach of measuring pneumonia because many of the cases reported in surveys by the mothers or caregivers with symptoms of pneumonia are in fact, not true pneumonia.[68,69] While this limitation does not affect the level and patterns of care-seeking for symptoms of ARI, it limits the validity of the level of treatment of ARI with antibiotics, as reported through household surveys. The treatment indicator described in this report must therefore be taken with caution.

Table TC.5.1 presents the percentage of children with symptoms of ARI, which is also generally referred to as symptoms of pneumonia, in the two weeks preceding the survey for whom care was sought, by source of care, including the first source of care. Information is not presented by sex, area, degree of urbanisation, microregion, age (in month), mother's education, type of medicine taken, mother's functional difficulties, and wealth index quintile due to the small unweighted number of children with symptoms of ARI in the last two weeks across the disaggregated categories.

Table TC.5.1: Care-seeking for symptoms of acute respiratory infection (ARI)

Percentage of children age 0-59 months with symptoms of ARI in the last two weeks for whom advice or treatment was sought, by source of advice or treatment, Ukraine MICS, 2025-26

	Percentage of children with symptoms of ARI for whom:								Number of children with symptoms of ARI in the last two weeks	Percentage of children with symptoms of ARI for whom advice or treatment was first sought from:						Number of children with symptoms of ARI for whom advice or treatment was sought
	Advice or treatment was sought from:						No advice or treatment sought	Advice or treatment was sought the same or next day from a health facility or provider		Health facilities or providers				Other source	A health facility or provider[B]	
	Health facilities or providers				Other source	A health facility or provider[1,B]				Public sector	Private sector	NGO sector	Community health provider[A]			
	Public sector	Private sector	NGO sector	Community health provider[A]												
Total[C]	80.8	5.7	0.2	12.2	9.6	84.2	9.4	72.0	89	87.2	5.2	0.0	11.3	7.5	92.5	81

[1] MICS indicator TC.19 - Care-seeking for children with acute respiratory infection (ARI) symptoms; SDG indicator 3.8.1

[A] Community health providers includes such public medical sector providers as: community health worker (paramedic, nurse, without hospitalization) and mobile/outreach clinic (state or municipal) and such private medical sector providers as: community health worker (non-government consultant) and mobile private clinic or a mobile team.

[B] Includes all public, private, and NGO health facilities and providers, as well as those who did not know if public, private, or NGO.

[C] The background characteristics "Sex", "Area", "Degree of urbanisation", "Macroregion", "Age (in months)", "Mother's education", "Type of medicine taken", "Mother's functional difficulties", and "Wealth index quintile" are not shown in the table due to the small unweighted number of children with symptoms of ARI in the last two weeks across the disaggregated categories.

7.7 Infant and young child feeding

Optimal infant and young child feeding practices can increase survival and promote healthy growth and development, particularly during the critical window from birth to 2 years of age.

Breastfeeding in the first few years of life protects children from infection, provides an ideal source of nutrients and is economical and safe.[70] Despite these critical benefits, breastfeeding practices are suboptimal in many parts of the world. Many children do not start breastfeeding early enough, do not breastfeed exclusively for the recommended six months or stop breastfeeding too soon.[71] Mothers often face pressures to switch to infant formula, which can contribute to growth faltering and micronutrient malnutrition. Infant formula and other breastmilk substitutes can also be life-threatening in settings where hygienic conditions and safe drinking water are not readily available. In some cases, it can be unsafe even with proper and hygienic preparation in the home due to food adulteration or other contamination that can affect unaware consumers.[72] As children reach the age of 6 months, their consumption of appropriate, adequate and safe complementary foods and continued breastfeeding leads to better health and growth outcomes, with the potential to reduce stunting during the first two years of life.[73]

UNICEF and WHO recommend that infants be: (i) breastfed within one hour of birth; (ii) breastfed exclusively for the first six months of life; and (iii) breastfed for up to 2 years of age and beyond.[74] Starting at 6 months, breastfeeding should be combined with safe, age-appropriate feeding of solid, semi-solid and soft foods with specific guiding principles available about how the feeding should be done with topics ranging from responsive feeding to avoidance of foods and beverages high in sugar, salt, and unhealthy fats.[75] The breastfeeding recommendations and guiding principles for complementary feeding for which standard indicators[76] have been developed, and which are collected in this survey, are listed in the table below.

Recommendation/ guiding principle	Indicators / proximate measures[77]	Notes on interpretation[78]	Table
Breastfeed within one hour of birth	**Early Initiation of breastfeeding** Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	This is the only indicator in the series based on historical recall, that is, of what happened up to 2 years before the survey interview. This indicator does not require that the infant suckled at the breast or that milk was transferred from breast to infant. It represents the practice of putting the baby to breast within the first hour, which is related to a number of positive outcomes including reduced mortality and exclusive breastfeeding.	TC 7.1
Breastfeed exclusively for the first six months of life	**Exclusive breastfeeding under 6 months** Percentage of infants under 6 months of age who are exclusively breastfed[79]	Captures the desired practice for the entire population of interest (i.e., all children age 0-5 months should be exclusively breastfed) in a 24-hour period. It does not represent the proportion of infants who are exclusively breastfed every day from birth until they are 6 months of age and should not be interpreted as such.	TC.7.2

[75] WHO. Guideline for complementary feeding of infants and young children 6–23 months of age. 2023. https://iris.who.int/bitstream/handle/10665/373358/9789240081864-eng.pdf?sequence=1

[76] World Health Organization and United Nations Children's Fund. Indicators for assessing infant and young child feeding practices: definitions and measurement methods. 2021. https://data.unicef.org/resources/indicators-for-assessing-infant-and-young-child-feeding-practices/

[77] It should be noted that these indicators are, in general, proximate measures which do not capture the exact recommendations or guidelines, but serve as a basis for monitoring, providing useful information on the population of interest.

[78] For all indicators other than early initiation of breastfeeding, the definition is based on current status, that is, what happened during the day before the survey from the time when the child woke up to the time when he/she went to sleep until the morning of the day of the interview.

[79] Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines.

Recommendation/ guiding principle	Indicators / proximate measures[77]	Notes on interpretation[78]	Table
Introduce solid, semi-solid and soft foods at the age of 6 months	**Introduction of solid, semi-solid or soft foods (age 6-8 months)** Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	Captures the desired practice for the entire population of interest (i.e., all children age 6-8 months should eat solids) in a 24-hour period. It does not represent the proportion of infants who began receiving solids when they turned 6 months nor the proportion of children age 6-8 months who received solids every day since they turned 6 months of age and should not be interpreted as such.	TC 7.3
Continue frequent, on-demand breastfeeding for two years and beyond	**Continued breastfeeding at 1 year** Percentage of children age 12-23 months (1 year) who received breast milk during the previous day	Captures the desired practice for children up to 2 years in a 24-hour period.	TC.7.2
Provide meals with appropriate frequency and energy density	**Minimum meal frequency (age 6–23 months)** Breastfed children: Depending on age, at least two or three meals/ snacks provided during the previous day Non-breastfed children: At least four meals/snacks and/or milk feeds provided during the previous day	This indicator represents the minimum number of meals and not adequacy. In addition, standard questionnaires do not distinguish if milk feeds were provided as part of a solid meal or as a separate meal. Meals may therefore be double counted for some non-breastfed children. Rates should not be compared between breastfed and non-breastfed children.	TC.7.4
Dietary diversity	**Minimum dietary diversity (age 6-23 months)** At least five of eight food groups[80] consumed in the 24 hours preceding the survey	This indicator represents the minimum dietary diversity and not adequacy. In addition, consumption of any amount of food from each food group is sufficient to "count" as the standard indicator is only meant to capture yes/no responses.	TC.7.4
Avoid unhealthy foods, beverages/dietary practices	**Sweet beverage consumption (age 6-23 months)** Percentage of children aged 6—23 months who consumed a sweet beverage during the previous day	Includes sweet beverages produced commercially, 100% fruit juice and juice drinks as well home-made drinks to which a sweetener has been added.	TC.7.7
	Unhealthy food consumption (age 6-23 months) Percentage of children aged 6—23 months who consumed selected sentinel unhealthy foods during the previous day	The indicator definition refers to "sentinel unhealthy foods". In this context, "sentinel unhealthy foods" are foods or categories of foods (e.g. "sweets" or "candies") that are likely to be consumed by infants and young children (IYC) and are high in sugar, salt and/or unhealthy fats.	
	Zero vegetable or fruit consumption (age 6-23 months) Percentage of children aged 6—23 months who did not consume any vegetables or fruits during the previous day	While there is no universal recommendation for the optimal number of servings of vegetables and fruits per day for IYC over six months of age, consumption of zero vegetables or fruits on the previous day represents an unhealthy practice.	
Nutrient supplements and fortified food products	No standard indicator exists		na
Safe preparation and storage of foods	While it was not possible to develop indicators to fully capture guidance, one indicator does cover part of the principle: Not feeding with a bottle with a nipple		TC.7.2
Responsive feeding	No standard indicator exists		na

[80] The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) Breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

In addition to the indicators in the table above, three dimensions of complementary feeding are combined to form a composite indicator of "minimum acceptable diet". This indicator assesses energy needs and nutrient adequacy (apart from iron). To have a minimum acceptable diet, a child must have received in the previous day:

(i) The appropriate number of meals, snacks, or milk-feeds;
(ii) Food items from at least 5 out of 8 food groups; and
(iii) At least two milk feeds for non-breastfed children.

Table TC.7.1 is based on mothers' reports of when their last-born child, born in the last two years, was first put to the breast. It indicates the proportion who were ever breastfed, as well as those who were first put to breast within one hour and one day of birth.

The set of infant and young child feeding indicators reported in tables TC.7.2 through TC.7.7 are based on the mother's report of consumption of food and liquids during the day or night prior to being interviewed. Data are subject to a number of limitations, some related to the respondent's ability to provide a full report on the child's liquid and food intake due to recall errors, as well as lack of knowledge in cases where the child was fed by other individuals.

In Table TC.7.2, breastfeeding status is presented for exclusively breastfed infants age 0-5 months (i.e. those who receive only breastmilk) and mixed milk feeding among infants age 0-5 months (i.e. those who receive breastmilk in addition to infant formula or milk from animals). The table also shows continued breastfeeding of children age 12-23 months and bottle feeding of children age 0-23 months.

Table TC.7.3 looks into the introduction of solid, semi-solid, or soft foods for infants age 6-8 months, while Table TC.7.4 presents the percentage of children age 6-23 months who received the minimum number and diversity of meals/snacks during the previous day (referring to solid, semi-solid, or soft food, but also milk feeds for non-breastfed children).

Table TC.7.5 presents the relatively new measure of Child Food Poverty, defined as those not meeting dietary diversity, i.e., to have received foods from 4 or fewer food groups during the previous day. Children who received foods from 2 or fewer food groups are considered to live in severe food poverty.

Tables TC.7.6 and TC.7.7 present consumption (and lack of consumption) of specific food groups during the night and day before the survey.

Table TC.7.1: Initial breastfeeding

Percentage of most recent live-born children to women age 15-49 years with a live birth in the last two years who were ever breastfed, put to breast within one hour of birth and within one day of birth, and who were fed exclusively with breast milk for the first two days after birth, Ukraine MICS, 2025-26

	Percentage who were ever breastfed[1]	Percentage of children who were first put to breast:		Percentage of children who were fed exclusively with breast milk for the first two days after birth[3]	Number of most recent live-born children to women with a live birth in the last 2 years

[1] MICS indicator TC.40 - Minimum milk feeding frequency for non-breastfed children

[2] MICS indicator TC.41 - Minimum dietary diversity; SDG indicator 2.2.4

[3] MICS indicator TC.42 - Minimum meal frequency

[4] MICS indicator TC.39 - Minimum acceptable diet (6-23 months)

[A] Minimum dietary diversity is defined as receiving foods from at least 5 of 8 food groups: 1) breastmilk, 2) grains, white/pale starchy roots, tubers, and plantains, 3) beans, peas, lentils, nuts and seeds, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

[B] Minimum meal frequency among currently breastfeeding children is defined as children who received solid, semi-solid, or soft foods 2 times or more daily for children age 6-8 months and 3 times or more daily for children age 9-23 months. For non-breastfeeding children age 6-23 month it is defined as receiving solid, semi-solid or soft foods, or milk feeds, at least 4 times with at least one of those feeds being a solid or semi-solid feed. For non-breastfeeding children age 6-23 months it is defined as receiving solid, semi-solid or soft foods, or milk feeds, at least 4 times with at least one of those feeds being a solid or semi-solid feed.

[C] The minimum acceptable diet for breastfed children age 6-23 months is defined as receiving the minimum dietary diversity and the minimum meal frequency, while it for non-breastfed children further requires at least 2 milk feedings.

[D] The background characteristic "Mother's functional difficulties" is not shown in the table because all mothers have no functional difficulty except in 2 cases.

[1] MICS indicator TC.705 - Child food poverty

[A] Child food poverty is defined as to have received foods from 4 or fewer food groups during the previous day. The moderate level of child food poverty is a maximum of 3-4 food groups and the severe level is 2 or fewer food groups. See Table TC.7.4 for the list of the 8 food groups.

[B] The background characteristic "Mother's functional difficulties" is not shown in the table because all mothers have no functional difficulty except in 2 cases.

7.8 Malnutrition

Children's nutritional status reflects their overall health. When children have regular access to an adequate diet, are protected from and given effective treatment for childhood illnesses, and are well cared for, they reach their growth potential and are considered well-nourished. Undernutrition is associated with nearly half of all child deaths worldwide.[81] Children with severe wasting have more than nine times higher odds of dying compared to children without wasting.[82] Malnutrition in early childhood also can impair physical and cognitive development and increase the risk of non-communicable diseases in adulthood. The Sustainable Development Goal target 2.2 is to reduce the prevalence of stunting among children under five by 40 per cent between 2012 and 2025, to reduce wasting to <5 per cent and to have no increase in overweight over the same period. A reduction in the prevalence of malnutrition contributes not only to SDG2.2 but is central to achievement of all 17 SDGs, specifically those related to health, education, gender equality and the climate.[83] A well-nourished population can provide a reference for how children should grow. The reference population used in this report is based on the WHO growth standards and reference data.[84] Malnutrition in a population can be gauged by comparing children to these reference populations. All of the nutritional status indicators, that is, weight-for-age, height-for-age, weight-for-height, and body mass index-for-age, can be expressed in standard deviation units (z-scores) from the median of the reference population.

Height-for-age is a measure of linear growth. Children whose height-for-age is more than two standard deviations below the median of the reference population are considered short for their age and are classified as moderately or severely stunted. Those whose height-for-age is more than three standard deviations below the median are classified as severely stunted. Stunting, or chronic malnutrition, is the result of failure to receive adequate nutrition in early life over an extended period and/or recurrent or chronic illness.

Weight-for-height can be used to assess wasting and overweight status of children under age 5. Children whose weight-for-height is more than two standard deviations below the median of the reference population are classified to have moderate or severe wasting, while those with weight-for-height more than three standard deviations below the median are classified with severe wasting. Wasting is usually the result of poor nutrient intake or disease. Wasting is a form of acute malnutrition, and the prevalence can change quickly in response to shocks or seasonal changes in the availability of food and/or disease prevalence.

Children whose weight-for-height is more than two standard deviations above the median reference population are classified as moderately or severely overweight, whereas more than three standard deviations are classified as severely overweight.

Weight-for-age is a measure of both acute and chronic malnutrition. Children whose weight-for-age is more than two standard deviations below the median of the reference population are considered moderately or severely underweight, while those whose weight-for-age is more than three standard deviations below the median are classified as severely underweight.

Body Mass Index (BMI) for age is used once children reach age 5 and then throughout life into adulthood. Similar to weight-for-age, BMI is used to assess whether children are overweight or thin for their height and age.

In MICS, weights and heights of all children under age 5 were measured. Additionally, anthropometric measurements were collected for children age 5-9 years. Among children randomly selected for the Questionnaire for children and adolescents age 5-17 (one child per household), all children age 5-9 years were measured. Measurements were done using the anthropometric equipment recommended by UNICEF.[85] Findings in this section are based on the indexes calculated from the heights, weights and birth dates collected during the survey interview.

Tables TC.8.1 and TC.8.2 show percentages of children under 5 years of age and age 5-9 years classified into each of the above-described categories, based on the anthropometric measurements that were taken during fieldwork. Additionally, the table includes mean z-scores for the anthropometric indicators.

Children are excluded from analysis of one or more of the anthropometric indicators when their weights and heights have not been measured or are implausible (flagged), or their age is not available, whichever applicable. For example, if a child has been weighed but his/her height has not been measured, the child is included in underweight calculations, but not in the calculations for stunting and wasting.

Percentages of children excluded and reasons for exclusion are shown in the data quality tables in section DQ.3 in Appendix D. The tables show that due to incomplete dates of birth, implausible measurements, and/or missing weight and/or height, 6.6 percent of children under 5 have been excluded from calculations of the weight-for-age indicators, 7.1 percent from the height-for-age indicators, and 7.6 percent for the weight-for-height indicators. For children age 5-9 years the tables show that due to incomplete dates of birth, implausible measurements, and/or missing weight and/or height, 7.1 percent of children age 5-9 have been excluded from calculations of the weight-for-age indicators, 7.2 percent from the height-for-age indicators, and 7.5 percent for the BMI-for-age indicators The primary reason for the exclusion of cases from anthropometric indicator calculations is missing data, predominantly resulting from the absence of height/length or weight measurements. Some digit preference is observed, especially for height/length measurements, as indicated by a higher index of dissimilarity for height/length than for weight. This suggests moderate rounding in recorded height/length values, while digit preference in weight measurements is less pronounced. Additionally, about 9 percent of children under five and those age 5-9 years wore more than very light clothing or only undergarments during weight measurement, which should be interpreted in the context of data collection during the winter time in Ukraine, conducted amid cold weather and disruptions to electricity and heating. These issues may introduce some measurement error, but do not indicate severe or systematic data quality problems.

Table TC.8.1: Nutritional status of children under 5

Percentage of children under age 5 by nutritional status according to three anthropometric indices: weight for age, height for age, and weight for height, Ukraine MICS, 2025-26

7.9 Responsive caregiving in early childhood

Early childhood is a crucial window of opportunity and is scientifically proven to be the most sensitive period for brain development. It is in these earliest years when interactions between young children and their environments have profound impacts on physical, cognitive, social and emotional development that extend into adulthood.[86] An optimal home environment during early childhood includes the availability of developmentally-appropriate playthings and books as well as opportunities for stimulating engagement with objects, the environment and caregivers.

Important indicators of the quality of a child's early home environment include the types of activities adults engage in with the child, the availability of books and playthings for the child in the home, and the conditions of the care the child receives.

The 2025-26 Ukraine MICS collected information on a range of activities that provide early stimulation and responsive care to young children. These include whether an adult member of the household did any of the following activities: read books to or looked at picture books with the child; told stories to the child; sang songs to or with the child; took the child outside the home, compound or yard; played with the child; spent time naming, counting, or drawing things for or with the child. The results are presented in Table TC.9.1.

During the 2025-26 Ukraine MICS, mothers/caregivers of children under 5 years of age were asked how many children's books or picture books they had for their child at home, and what types of toys and objects the child played with at home. The findings are presented in Table TC.9.2.

Research shows that leaving children without adequate supervision is a risk factor for unintentional injuries.[87] In the 2025-26 Ukraine MICS, two questions were asked to find out whether children age 0-59 months were left alone during the week preceding the interview, and whether children were left in the care of other children under 10 years of age. Results are presented in Table TC.9.3.

Table TC.9.1: Early stimulation and responsive care

7.10 Early childhood development index

Early childhood development is a multidimensional outcome that is the result of an ordered progression of motor, cognitive, language, socio-emotional and regulatory skills and capacities acquired across the early years.[88] While these are distinct domains of early childhood development, they are interconnected. Nurturing and supporting all these dimensions in a holistic manner is key to ensuring children have the best chance to reach their full potential. [89]

The Early Childhood Development Index 2030 (ECDI2030) module captures the achievement of key developmental milestones by children between the ages of 24 and 59 months. The data generated by the ECDI2030 can be used for monitoring and reporting on SDG indicator 4.2.1, and to inform government efforts to improve developmental outcomes among children.

The measure includes 20 questions about the way children behave in certain everyday situations, and the skills and knowledge they have acquired, reflecting the increasing difficulty of the skills children acquire as they grow. The 20 items are organised according to the three general domains of health, learning and psychosocial well-being. A child is considered to be developmentally on track if they have achieved the minimum number of milestones expected for their age group. Each of the three general domains is composed of a set of core sub-domains:

- Health sub-domains: gross motor development, fine motor development and self-care.
- Learning sub-domains: expressive language, literacy, numeracy, pre-writing, and executive functioning.
- Psychosocial well-being sub-domains: emotional skills, social skills, internalising behaviour, and externalising behaviour.

The ECDI2030 module is not designed to report on individual domains separately. Rather, it is meant to produce a single summary score that captures the interlinked developmental concepts embedded in the three domains mentioned in SDG 4.2.1.[90]

The indicator derived from the ECDI2030 module is the percentage of children age 2-4 years who are developmentally on track in health, learning and psychosocial well-being.[91] The findings are presented in Table TC.10.1.

[88] UNICEF et al. Advancing Early Childhood Development: From Science to Scale. Executive Summary, The Lancet, 2016. https://www.thelancet.com/pb-assets/Lancet/stories/series/ecd/Lancet_ECD_Executive_Summary.pdf.

8. Learn and acquire skills

8.1 Early childhood education

Early childhood education (ECE) programmes are designed to promote young children's cognitive, social, emotional and physical development and introduce them to organised instruction outside of the family context[92]. ECE aim to develop the socio-emotional skills necessary for participation in society and the academic skills needed for entry into primary education, playing a crucial role in promoting school readiness. ECE corresponds to the International Standard Classification of Education (ISCED) Level 0 and includes two categories (early childhood educational development designed for children aged 0 to 2, and preschool education for children from age 3 to the start of primary education). ECE programmes may be referred to in many ways (early childhood education and development, play school, reception, pre-primary, preschool or *educación inicial*). Programmes for younger children provided in *crèches*, daycare centres, nurseries or *guarderías* that do not include organized learning components (such as baby-sitting services) do not meet the ISCED level 0 classification criteria[92].

Preschool education is a crucial stage in a child's holistic development in Ukraine. Today, its curriculum is organically linked to the principles of the New Ukrainian School: it ensures continuity between preschool and elementary education in the context of school reform[93].

In Ukraine, preschool education is a mandatory part of the continuous learning system. Responsibility for a child's education in preschool lies with the child's parents or guardians and the educational institutions where the children are enrolled.

Currently, the following types of educational institutions exist in Ukraine:

- nursery — a type of educational institution that provides preschool education to children aged three months to three years;
- kindergarten — a type of educational institution that provides preschool education to children aged two to six or seven years, and to children with special educational needs — up to seven or eight years of age;
- special kindergarten — a type of educational institution that provides preschool education to children with special educational needs resulting from physical, mental, intellectual, and/or sensory impairments or behavioral disorders, aged two to seven or eight years;
- mobile kindergarten — a type of educational institution that provides preschool education services at the children's place of residence, including through the use of or based on a vehicle specially equipped to provide such services;
- family-based daycare — a type of educational institution located at the family's place of residence in a private home, providing educational services to children from birth who are related to the family and/or to children who are not members of the family;
- mini-daycare center — a type of educational institution accommodating no more than five children at a time;
- educational partnership center — a type of educational institution that supports the development of children from birth with the mandatory participation of their parents or one of them;
- child development center — a type of educational institution that provides preschool education to children (including those receiving preschool education at other educational institutions or at home), particularly through specific partial programs, and/or provides them with specific psychological, pedagogical, and remedial-developmental services.

On January 1, 2025, the new Law of Ukraine "On Preschool Education" No. 3788-IX came into effect. The law defines "a child-centered and person-oriented approach to a child's development in accordance with their individual characteristics, needs, interests, abilities, talents, and freedom of choice" (Article 5). This means that state authorities, local self-government bodies, educational institutions, and their founders must prioritize the best interests of every child when carrying out such activities or making administrative decisions[94].

Table LN.1.1 shows the percent of children age 3 and 4 years currently attending early childhood education. A child currently attending school is a child who regularly attends school at the time of the survey. If the child is not attending school at the time of the interview due to school holidays or breaks, but the child regularly attends school, the child is considered as currently attending school. This indicator is based on question UB8 in the Questionnaire for Children Under 5.

Table LN.1.2 looks at children's exposure to organised learning programmes in the year before the official primary entry age. The official primary school entry age in Ukraine is age 6 years. but, the law also allows children to start school at age seven. Table LN.1.2 therefore refers to children who were 5 years old at the beginning of the school year.[95] In Ukraine, the school year begins in September.

The indicator corresponds to SDG indicator 4.2.2: Participation rate in organized learning (one year before the official primary entry age) and is calculated as an adjusted[96] net attendance rate (ANAR). This indicator is based on question UB7 in the Questionnaire for Children Under 5.

Additionally, Table LN.1.2 presents the gender, wealth and area parity indices for SDG indicator 4.2.2. These indices contribute to SDG indicator 4.5.1: Parity indices (female/male, rural/urban, bottom/top wealth quintile and others such as disability status, indigenous peoples and conflict-affected, as data become available) for all education indicators that can be disaggregated. Generally, when a parity index value falls between 0.97 and 1.03, it is regarded as parity between two groups. The likely more disadvantaged group (e.g., female, poor and rural) is placed in the numerator, so parity index values below 0.97 indicate disadvantage for those groups. For example, in the gender parity index (GPI), a value between 0.97 and 1.03 indicates parity between the sexes, a GPI value lower than 0.97 indicates female disadvantage and a value greater than 1.03 suggests male disadvantage. The further from 1.00 that a parity index lies, the greater the disparity between groups. The indices do not reveal the overall indicator levels, as parity may be achieved, while overall levels for both groups are low.

Parity indices are also presented in Table LN.2.8 (for attendance to primary, lower and upper secondary school).

[95] In MICS, the age of household members is recorded as their age at the time of the survey. This age is used to determine eligibility for individual questionnaires, modules and questions, and also serves to define the numerators and denominators for many indicators. However, when estimating education-related indicators that are based on children's age, such as adjusted net attendance rates, completion rates, and others, a variable is created to reflect the child's age at the beginning of the school year. This approach addresses potential issues related to the timing and duration of survey fieldwork and ensures that findings are comparable across countries, while also accounting for age criteria for school enrolment. In the tables of this chapter, "Age at the beginning of the school year" is specified in rows and columns where applicable, distinguishing it from the term "age", which refers to the child's age at the time of the survey.

[96] Rates presented in this table are "adjusted" since the numerator includes children one year younger than the official primary entry age attending either ECE or primary education.

8.2 Attendance

Ensuring that all girls and boys complete primary and secondary education is a target of the of the 2030 Agenda for Sustainable Development. Education is a vital prerequisite for combating poverty, empowering women, economic growth, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

In Ukraine, children usually enter primary school at age 6[97], lower secondary at age 10 and upper secondary school at age 15. There are 4 grades in primary school and 5 + 2 grades in secondary school. In primary school, grades are referred to as grade 1 to grade 4. For lower secondary school, grades are referred to as grade 5 to grade 9 and in upper secondary to as grade 10 to grade 11. The school year typically runs from September of one year to May of the following year.

To achieve comparability between varying national educational systems and classifications across the world, the United Nations Educational, Scientific and Cultural Organization (UNESCO) maintains the ISCED statistical framework. Its defined levels and coding are used in computation of MICS Indicators.[98] With focus on completion of primary and secondary education, indicators are centred on levels 0-3 presented in the table of classifications below.

ISCED 2011		Education system in Ukraine	
Level	ISCED Name	Name of education level in:	
		Ukrainian	English
0	Early childhood education and care	Дошкільна освіта	Preschool education
1	Primary	Початкова освіта	Primary school
2	Lower secondary	Базова середня освіта	Basic secondary
3	Upper secondary	Профільна середня (Повна загальна середня) освіта	Profile secondary (complete general secondary)
		Професійна (професійно-технічна) освіта	Vocational (vocational-technical)

The post-secondary level 4-8 are not detailed in this table, but include 4: Post-secondary non-tertiary, 5: Short-cycle tertiary, 6: Bachelor's or equivalent, 7: Master's or equivalent, and 8: Doctoral or equivalent

Attendance to pre-primary education is important for the readiness of children to school. Table LN.2.1 shows the proportion of children in the first grade of primary school (regardless of age) who attended preschool the previous year.[99]

Table LN.2.2 presents the percentage of children of primary school entry age entering Primary grade 1. The age group covered by this indicator refers to children who are six years old at the beginning of the school year.

Table LN.2.3 provides the percentage of children of primary school age (6 to 9 years at the beginning of school year) who are attending primary or secondary school[100], and those who are out of school. Similarly, Table LN.2.4 presents the percentage of children of lower secondary school age (age 10 to 14 years at the beginning of school year) who are attending lower secondary school or higher education levels[101], and those who are out of school.

In Table LN.2.5, children are distributed according to their age against current grade of attendance (age-for-grade). For example, an 8-year-old child (at the beginning of the school year) is expected to be in Primary grade 3, as per the official intended age-for-grade. If this child is currently in Primary grade 1, he/she will be classified over-age by 2 years. The table includes both primary and lower secondary levels.

[97] Primary education is usually acquired starting from the age of 6. Children aged 7 at the beginning of the school year shall start primary education in the same school year. (Law of Ukraine On Education on September 5, 2017 № 2145-VIII, Article 12, Paragraph 4)

[98] ISCED is periodically revised by UNESCO (latest in 2011) in consultation with countries. National ISCED mappings are published here (accessed 7 July 2025): https://isced.uis.unesco.org/data-mapping/.

[99] The computation of the indicator does not exclude repeaters. It is therefore inclusive of both children who are attending primary school for the first time, as well as those who were in the first grade of primary school the previous school year and are repeating. Children repeating may have attended pre-primary education prior to the school year during which they attended the first grade of primary school for the first time; these children are not captured in the numerator of the indicator.

[100] Rates presented in this table are "adjusted" since they include not only primary school attendance, but also lower and upper secondary school attendance in the numerator.

[101] Rates presented in this table are "adjusted" since they include not only lower secondary school attendance, but also attendance to higher education levels in the numerator.

Table LN.2.6 presents the percentage of children of upper secondary school age (age 15 to 16 years at the beginning of school year) who are attending upper secondary school or higher[102], and those who are out of school.

The gross intake ratio to the last grade of primary school, primary school completion rate and transition rate to secondary education are presented in Table LN.2.7. The gross intake ratio is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year.

The completion rate of primary education refers to the percentage of a cohort of children age 3 to 5 years above the official intended age for the last grade of primary education who have completed primary education. The intended age for the last grade of primary is the age at which children would enter the last grade of primary school if they had started school at the official primary entry age and had progressed without repeating or skipping a grade. In Ukraine, the official age of entry into primary school is age 6 years. With 4 grades in primary school, the intended age for the last grade of primary is therefore 9 years, and the reference group for the completion rate of primary education is children age 12 to 14 years. Completion rates are also presented for lower and upper secondary education. The official intended age for the last grades of lower and upper secondary school are 14 and 16 years, respectively. Thus, denominators for the lower and upper secondary completion rates are children age 17 to 19 years and children age 19 to 21 years, respectively.

The table also provides the "effective" transition rate[103], defined as the percentage of children who continued to the next level of education – the number of children who are attending the first grade of the higher education level in the current school year and were in the last grade of the lower education level the previous year divided by the number of children who were in the last grade of the lower education level the previous school year and are not repeating that grade in the current year.

A low effective transition rate indicates that a low percentage of students are transitioning to the next level of education. This brings to light the existence of potential barriers in an education system including: financial burden such as enrolment fees or the obligation to purchase textbooks or school uniforms; education supply and quality issues such as a limited number of teachers or classrooms and low-quality teaching; as well as social and individual beliefs on education such as low expectation in returns of advancing in education.

Table LN.2.8 presents the gender parity indices (GPI) for the adjusted primary and secondary net attendance rates provided in Tables LN.2.3, LN.2.4, and LN 2.6. It also presents additional parity indices contributing to SDG 4.5.1, as described for Table LN.1.2.

[102] Rates presented in this table are "adjusted" since they include not only upper secondary school attendance, but also attendance to higher education levels in the numerator.

[103] The simple transition rate, which is no longer calculated in MICS, tends to underestimate pupils' progression to secondary school as it assumes that the repeaters never reach secondary school.

Table LN.2.1: School readiness

Percentage of children attending the first grade of primary school who attended preschool during the previous school year, Ukraine MICS, 2025-26

[1] MICS indicator LN.5b - Lower secondary school net attendance rate (adjusted)

[2] MICS indicator LN.6b - Out-of-school rate for children of lower secondary school age

[A] The percentage of children of lower secondary school age out of school are those not attending any level of education.

[B] The disaggregate of Mother's education is not available for children age 15-17 years identified as emancipated or those age 18 at the time of interview.

[C] Although primary education generally begins at age six, the law also allows children to start school at age seven. As a result, children who started school at age seven are still in primary education at age 10, contributing to the lower percentage.

( ) Figures that are based on 25–49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

[1] Parity indices - MICS indicators LN.5a/LN.5b/LN.5c

[A] The disaggregate of Mother's education is not available for children age 15-17 years identified as emancipated or those age 18 at the time of interview. The sum of cases in the disaggregate may not equal the total denominator.

[B] Orphans are children whose biological parents (both mother and father) are not alive. Non-orphans are children for whom at least one parent is alive.

na: not applicable

( ) Figures that are based on 25–49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

„–" Denotes 0 unweighted cases in the denominator

8.3 Household involvement in education

Parental involvement in their children's education is widely accepted to have a positive effect on their child's learning performance. For instance, reading activities at home have significant positive influences on reading achievement, language comprehension and expressive language skills.[104] Research also shows that parental involvement in their child's literacy practices is a positive long-term predictor of later educational attainment.[105]

Beyond learning activities at home, parental involvement that occurs in school (like participating in school meetings, talking with teachers, attending school meetings and volunteering in schools) can also benefit a student's performance.[106] Research studies have shown that, in the primary school age range, the impact of parental involvement in school activities can even be much bigger than differences associated with variations in the quality of schools, regardless of social class and ethnic group.[107] Table LN.3.1 presents percentages of children age 7-14 years for whom an adult member of the household received a report card for the child, attended a meeting called by the school governing body, and met with teachers to discuss child's progress in the last year.

Table LN.3.2 shows learning environment at home, i.e., percentage of children with 3 or more books to read, percentage of children who have homework, and percentage of children who receive help with homework.

8.5 Youth employment and training

Youth engagement in education, employment, or training plays a crucial role in promoting social inclusion, skill development, and a successful transition into the workforce. Conversely, young people who are not engaged in any of these activities are at a higher risk of social exclusion. They may face economic hardships and lack the skills to improve their economic conditions[108].

Youth not in education, employment, or training (NEET) is a broader measure of potential youth labour market entrants than youth unemployment and offers a clearer picture of the lost potential for human resource development, compared to the youth inactivity rate. Three SDG targets are closely tied to youth skills and employment, underscoring the importance of addressing these areas to promote economic empowerment for young people:

- Target 4.3: By 2030, ensure equal access for all women and men to affordable and quality technical, vocational and tertiary education, including university
- Target 4.4: By 2030, substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs and entrepreneurship
- Target 8.6: By 2020, substantially reduce the proportion of youth not in employment, education or training

The 2025-26 Ukraine MICS collected relevant information only for female youth. Table LN.5.1W presents the indicators related to Targets 4.3[109] and 8.6, whereas the indicators related to Target 4.4 are presented in the ICT section at the end of this chapter. Table LN.5.1W also includes MICS indicator LN.703: Early leavers from education and training (ELET).

Table LN.5.1W: Youth education, employment and training (women)

Percentage of adolescent girls and young women age 15-24 years in formal education[A], not in formal education but in non-formal education or training, in formal or non-formal education or training during the previous 12 months, percentage in formal education, not in formal education but in training, not in formal education or training but in employment, not in education, employment or training during the previous week, percentage completing at most lower secondary education, and percentage completing at most lower secondary and not in education or training in the previous 4 weeks, Ukraine MICS, 2025-26

	Percentage of women age 15-24 who in the previous 12 months:			Percentage of women age 15-24 years who:				Percentage of women age 15-24 years who have:			Number of women age 15-24 years

[1] MICS indicator LN.701 - Participation rate of youth in formal and non-formal education and training; SDG indicator 4.3.1

[2] MICS indicator LN.702 - Proportion of youth not in education, employment or training (NEET); SDG indicator 8.6.1

[3] MICS indicator LN.703 - Early leavers from education and training (ELET)

[A] Attending formal education is defined as attending at any time during the current school year. It is not possible to compute those atttending at any time during the previous 12 months, as including those attending at any time in the previous school year would include a period outside 12 months.

(*) Figures that are based on fewer than 25 unweighted cases

The MICS Youth Employment and Training module is based on the International Labour Organization (ILO) Labour Force Survey[110] core questionnaire modules. However, the module only captures the relevant information that is required for the specific tabulated indicators. For example, once a respondent indicates they are in school, employment-related information is not collected because school attendance excludes them from being categorised as "Not in Education, Employment, or Training". As a result, the data collected through this module cannot be used to compute the percentage of individuals engaged in training or employment, nor to determine the nature of their employment. Such information should be obtained through dedicated and comprehensive instruments, like the Labour Force Survey.

8.6 ICT equipment, use, and skills

The 2025-26 Ukraine MICS collected information on exposure to mass media and the use of computers and the internet. Table LN.6.1 presents information on the household ownership of ICT equipment (radio, television, fixed telephone line, mobile telephone or smartphone[111] and computer) and access to internet.

Table LN.6.1: Household ownership of ICT equipment, access to internet, and use of mobile for financial transactions
Percentage of households with a radio, a television, a telephone and a computer, have access to the internet at home, and where at least one member uses a mobile phone for financial transactions, Ukraine MICS, 2025-26

(*) Figures that are based on fewer than 25 unweighted cases

[111] In addition to the specific question in the Household Questionnaire about whether any member of this household has a mobile phone, households are considered as owning mobile phone if any individual woman age 15-49 years responded yes to the question about ownership of mobile telephones in the individual questionnaires for women age 15-49 years.

Table LN.6.2W presents the use of ICT by women age 15-49 years based on the information about whether they have ever used computers, mobile phones or internet and during the last three months while table LN.6.3W presents the ICT skills of women age 15-49 years based on the information about whether they carried out computer related activities in the last three months.

Table LN.6.2W_SS: Use of ICT

Percentage of women age 15-49 years who have ever used a computer, the internet and who own a mobile phone, percentage who have used during the last 3 months and percentage who have used at least once weekly during the last 3 months, Ukraine MICS, 2025-26

9. Protected from violence and exploitation

9.1 Child discipline

Teaching children self-regulation is an integral part of parenting in all cultures. Too often however, children are raised using punitive or harsh disciplinary methods that rely on the use of physical force or verbal intimidation to obtain desired behaviours. A large body of evidence[112] confirms that violent discipline is both ineffective and can have harmful consequences, which range from immediate impacts to long-term harm that children carry forward into adult life.

In the 2025-26 Ukraine MICS, mothers or caregivers of children under age five and of one randomly selected child aged 5-17 were asked a series of questions on the methods adults in the household used to discipline the child during the past month and if the respondent believes that physical punishment is a necessary part of child-rearing. Tables PR.2.1 and PR.2.2 present the results.

Table PR.2.1: Child discipline

9.2 Child labour

Children around the world are routinely engaged in paid and unpaid forms of work that are not harmful to them. However, they are classified as child labourers when they are either too young to work or are involved in hazardous activities that may compromise their physical, mental, social or educational development. Article 32 (1) of the CRC states: "States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development".

The legislative regulation of the employment of minors in Ukraine is based on two complementary acts, where the key role is played by the Labor Code of Ukraine (LCU), which in Article 188 clearly limits the minimum age for employment, in Article 51 guarantees reduced working hours for adolescents, and in Articles 190 and 192 categorically prohibits the involvement of persons under 18 years of age in heavy, harmful, dangerous, night or overtime work[113]. This regulatory framework is detailed in Article 21 of the Law of Ukraine "On the Protection of Childhood", which directly implements international definitions on the prevention of the exploitation of child labor and guarantees the protection of the health, safety and comprehensive development of the child[114].

The child labour module was administered for one randomly selected child age 5-17 years in each household and includes questions on the type of work a child does and the number of hours he or she is engaged in it. Data are collected on both economic activities (paid or unpaid work for someone who is not a member of the household, work for a family farm or business) and domestic work (household chores such as cooking, cleaning or caring for children, as well as collecting firewood or fetching water).[115,116,117]

Table PR.3.1 presents children's involvement in economic activities. The methodology of the MICS Indicator on Child labour uses three age-specific thresholds for the number of hours children can perform economic activity without being classified as child labourers. A child that performed economic activities during the last week for more than the age-specific number of hours is classified as in child labour:

i. age 5-11: 1 hour or more

ii. age 12-14: 14 hours or more

iii. age 15-17: 43 hours or more

Table PR.3.2 presents children's involvement in household chores. As for economic activity above, the methodology also uses age-specific thresholds for the number of hours children can perform household chores without being classified as child labourers. A child that performed household chores during the last week for more than the age-specific number of hours is classified as in child labour.[118]

i. age 5-11 and age 12-14:

   21 hours or more, that is, children age 5-14 years are classified as child labourers if they have spent at least 21 hours on household chores during the last week.

ii. age 15-17:

   No limit to number of hours, that is, children age 15-17 years are not classified as child labourers based on time spent on household chores. For children in this age group, only the number of hours spent on economic activities in the last week is used for classification.[119]

[113] Labor Code of Ukraine, Pub. L. No. 322-VIII (1971). https://zakon.rada.gov.ua/laws/show/322-08

[114] Law of Ukraine No. 2402-III "On the Protection of Childhood" (2001). https://zakon.rada.gov.ua/laws/show/2402-14

[115] 'Own use production of goods', including activities such as fetching water and collecting firewood, falls within the production boundary set by the United Nations System of National Accounts. However, for the purpose of SDG reporting of indicator 8.7.1, and with the goal of facilitating international comparability, fetching water and collecting firewood have been classified as unpaid household services (i.e., household chores), a form of production that lies outside the production boundary.

[116] UNICEF. How Sensitive Are Estimates of Child Labour to Definitions?. MICS Methodological Paper No. 1. New York: UNICEF, 2012. https://data.unicef.org/wp-content/uploads/2015/12/Child_Labour_Paper_No.1_FINAL_162.pdf

[117] The Child Labour module was administered in the Questionnaire for Children Age 5-17 (See Appendix E: Questionnaires). In households with at least one child age 5-17, one child was randomly selected. To account for the random selection, the household sample weight is multiplied by the total number of children age 5-17 in each household; this weight is used when producing the relevant tables.

[118] Note that the age-specific thresholds for household chores have changed during the implementation of the sixth round of MICS. Comparison to other data sources, including previous MICS surveys, should be done with caution.

[119] The threshold value (21 hours) for children aged 15-17 years specified in Table PR.3.2 is provided for comparison purposes only.

SDG Target 8.7 aims to "take immediate and effective measures to eradicate forced labour, end modern slavery and human trafficking and secure the prohibition and elimination of the worst forms of child labour, including recruitment and use of child soldiers, and by 2025 end child labour in all its forms." The SDG indicator 8.7.1 is defined as the proportion of children aged 5-17 years who are engaged in child labour. Two indicators are presently in use for measuring child labour within the context of SDG monitoring and reporting. The first based on the production boundary set by the United Nations System of National Accounts (using above age-thresholds on economic activities alone) and the second based on the general production boundary (classifying child labour if age-specific thresholds are exceeded on either or both economic activities or household chores). Table PR.3.3 presents both of these two measures. The MICS Indicator PR.3 Is based on the second, i.e. using the general production boundary.

Pertaining to the overall concept of child labour, the module also collects information on hazardous working conditions. Table PR.3.4 presents the percentage of children involved in each of the hazardous activities included in the survey. Note, however, that the present definition, also used for SDG reporting, does not include involvement in hazardous working conditions, as further methodological work is needed to validate questions specifically aimed at identifying children working under such hazardous conditions.

Table PR.3.1: Children's involvement in economic activities

Percentage of children age 5-17 years by involvement in economic activities during the previous week, by age groups, Ukraine MICS, 2025-26

[A] The definition of the child labour indicator used for SDG reporting does presently not include hazardous working conditions. Work is ongoing to increase the types of hazardous working conditions captured and update the indicators definition. This column presents a definition comparable the original version of the MICS indicator, used early in the MICS6 round. The current SDG indicator is presented in Table PR.3.3.

[B] Includes attendance to preschool

[C] The disaggregate of Mother's education is not available for children age 15-17 years identified as emancipated.

[D] The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e. individually interviewed women age 18-49 years in selected households.

9.3 Child marriage

Marriage[120] before the age of 18 is violation of human rights, yet remains a reality for many children. The right to 'free and full' consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be 'free and full' when one of the parties involved is not sufficiently mature to make an informed decision about a life partner. In the Sustainable Development Goals, child marriage has been identified as a harmful practice which the world should aim to eliminate by 2030.

Child marriage is more common among girls than boys, but does occur around the world among children of both sexes. The impacts specific to boys married in childhood are not yet well understood, but marriage does place boys in an adult role accompanied by responsibilities for which they may not be prepared.

In many parts of the world parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage compromises the development of girls and often results in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty.[121]

Closely related to the issue of child marriage is the age at which sexual activity – and for females, childbearing – may begin. Women who were married before the age of 18 tend to have more children than those who marry later in life and are less likely to receive maternal health care services.[122,123] In addition, pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19.

Table PR.4.1W presents the percentage of women married before ages 15 and 18 years, and the percentage of adolescent girls age 15-19 years who are currently married.

Table PR.4.2W presents the proportion of women who were first married or entered into a marital union before age 15 and 18 by area and age groups. Examining the percentages married before ages 15 and 18 across different age groups allow for trends to be observed in child marriage over time.

Another component is the spousal age difference with the indicator being the percentage of women who are currently married or in union and 10 or more years younger than their current spouse. Table PR.4.3 presents the results of the age difference between women and their husband or partner.

[120] All references to marriage in this chapter include cohabiting unions as well.

9.4 Feelings of safety

Questions about fear, such as feelings of safety and perceptions of crime as a problem, indicate respondents' level of perceived safety in everyday life. This is important as such perceptions limit people's freedom of movement and influence how they manage threats to their safety.[124]

Table PR.6.1W presents data for women age 15-49 years on their feelings of safety for walking alone in their neighbourhood after dark and for being at home alone after dark.

[124] United Nations Office on Drugs and Crime, and United Nations Economic Commission for Europe. Manual on Victimization Surveys. Geneva: UN. https://www.unodc.org/documents/data-and-analysis/Crime-statistics/Manual_on_Victimization_surveys_2009_web.pdf.

Table PR.6.1W_SS: Feelings of safety

Percent distribution of women age 15-49 years by feeling of safety walking alone in their neighbourhood after dark and being home alone after dark, Ukraine MICS, 2025-26

	Percent distribution of women who walking alone in their neighbourhood after dark feel:						Total	Percentage of women who feel safe walking alone in their neighbourhood after dark[1]	Percent distribution of women who being home alone after dark feel:						Total	Percentage of women who feel safe home alone after dark	Percentage of women who after dark feel very unsafe walking alone in their neighbourhood or being home alone	Number of women

9.5 Attitudes towards domestic violence

2025-26 Ukraine MICS assessed the attitudes of women age 15-49 years towards wife beating by asking the respondents whether they think that husbands are justified to hit or beat their wives in a variety of situations. The purpose of these questions is to capture attitudes that justify the use of violence against girls and women when traditionally defined gender roles are not fulfilled or upheld. It is not a direct measure of the prevalence of partner violence but can offer clues on how girls and women are perceived within a society and prevailing social norms about their status and expected roles. The responses to these questions can be found in Table PR.7.1W.

Table PR.7.1W: Attitudes toward domestic violence (women)

Percentage of women age 15-49 years who believe a husband is justified in beating his wife in various circumstances, Ukraine MICS, 2025-26

	Percentage of women who believe a husband is justified in beating his wife:						Number of women
	If she goes out without telling him	If she neglects the children	If she argues with him	If she refuses sex with him	If she burns the food	For any of these five reasons[1]

10. Live in a safe and clean environment

10.1 Drinking water

Access to safe drinking water, sanitation, and hygiene (WASH) is essential for good health, welfare and productivity and is widely recognised as a human right[125]. Inadequate WASH is primarily responsible for the transmission of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid, and polio. Diarrhoeal diseases exacerbate malnutrition and remain a leading global cause of child deaths.

Drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development. While improving water quality is critical to prevent disease, improving the accessibility and availability of drinking water is equally important, particularly for women and girls who usually bear the primary responsibility for carrying water, often for long distances.[126] Similarly, the impact of inadequate drinking water on health, welfare and productivity varies across different population subgroups and disaggregated data are crucial for assessing inequalities.

The SDG targets relating to drinking water aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.1) in households. For more information on global targets and indicators please visit the website of the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP).[127]

The distribution of household members by main source of drinking water is shown in Table WS.1.1. The household members using `improved sources' of drinking water are those using any of the following types of supply: piped water (into dwelling, to yard or plot, to neighbour, public tap/standpipe), tube well/borehole, protected well, protected spring, tanker-truck, cart with small tank, water kiosk, bottled water, and large bottle. Unimproved sources of drinking water are unprotected wells, unprotected springs.

Table WS 1.2 shows the distribution of household members with drinking water on premises (piped into dwelling, yard, or plot, reported to be located in own dwelling, yard/plot, or where households do not collect water) and the amount of time taken per round trip to collect water (including queuing) for users of improved and unimproved sources. Household members using improved water sources located on premises or requiring up to and including 30 minutes per trip for water collection meet the SDG criteria for 'at least basic' drinking water services (SDG indicator 1.4.1). For this and subsequent tables, piped water is not further disaggregated by whether it is piped into the dwelling, yard or plot, as reported use of piped water is almost exclusively piped into the dwelling. These categories are therefore combined for disaggregation and presentation purposes.

Table WS.1.3 presents the distribution of household members without drinking water on premises disaggregated by the sex and age of the household member usually responsible for water collection. Table WS.1.4 shows the average time spent per trip by the household member mainly responsible for collecting drinking water disaggregated by sex and age.

Table WS.1.5 shows the percentage of household members with drinking water available in sufficient quantities when needed in the last month and in the last 12 months. Table WS.1.5S further presents the percent distributions of the main reasons households were unable to access water in sufficient quantities when needed the last time it happened, in the last month and in the last year.

Table WS.1.6 presents the distribution of household members with an indicator of faecal contamination detected in their drinking water source (point of collection), disaggregated by source of drinking water tested. The risk of faecal contamination is shown based on the number of *Escherichia coli* (*E. coli*) bacteria detected, ranging from low (<1 *E. coli* per 100 mL), to moderate (1-10 *E. coli* per 100 mL), high (11-100 *E. coli* per 100 mL) and very high risk (>100 *E. coli* per 100 mL). Table WS.1.7 shows the proportion of household members with *E. coli* detected in their household drinking water (point of consumption). Contamination may occur between the source and the household during transport, handling, and storage.

Table WS.1.8 shows the percentage of household members with improved and unimproved drinking water sources accessible on premises, available when needed, and free from faecal contamination (at point of collection). Households with improved sources accessible on premises, with sufficient quantities of water available when needed, and free from faecal contamination meet the SDG criteria for 'safely managed' drinking water services (SDG indicator 6.1.1).

[125] The human rights to water and sanitation were explicitly recognised by the UN General Assembly and Human Rights Council in 2010 and in 2015.

[126] WHO, and UNICEF. Safely Managed Drinking Water: thematic report on drinking water. Geneva: WHO Press, 2017. https://data.unicef.org/wp-content/uploads/2017/03/safely-managed-drinking-water-JMP-2017-1.pdf

[127] JMP website. Accessed July 7 2025. https://washdata.org/

Table WS.1.9 presents the main methods by which households report treating water in order to make it safer to drink. Boiling water, adding bleach or chlorine, using a water filter (ceramic, sand, composite, etc.), and using solar disinfection are considered appropriate methods of water treatment.

In addition to the standard MICS water quality module, the 2025–26 Ukraine MICS included a non-standard laboratory component, implemented in cooperation with the Public Health Center of the Ministry of Health of Ukraine and the regional Centres for Disease Control and Prevention, to assess selected physicochemical characteristics of source drinking water. While the standard module focuses primarily on microbiological contamination, this additional component provided complementary information on the chemical and physical quality of drinking water through testing for iron, nitrates, free residual chlorine, color, and turbidity. Compared with microbiological indicators, these physicochemical parameters are generally less subject to short-term fluctuations and provide a more consistent characterization of the quality of the drinking water source. Given the diversity of Ukraine's natural conditions, and water sources, the testing aimed to provide a better understanding of variations in source water quality across different regions and types of water sources. Following the protocol developed by the MICS team in cooperation with the Public Health Center and the regional Centres for Disease Control and Prevention, respondents in households selected for the water quality module were asked during the main household interview to consent to laboratory testing of their source drinking water. If consent was obtained, personnel from the relevant regional Centre for Disease Control and Prevention contacted the household, arranged a separate visit, and independently collected the water sample for laboratory analysis in accordance with national requirements for sample collection, transportation and testing. Following laboratory analysis, the laboratories provided the MICS team with test reports containing the results. Laboratory testing of the drinking water source was generally planned to take place approximately two weeks after the household visit during which the E. coli sample was collected. However, efforts were made to ensure that both samples were collected from the same drinking water source.

Table WS.1.11_SS presents the percentage of household members whose drinking water meets the quality standards for iron, nitrate, colour, and turbidity, as well as the percentage of household members whose drinking water meets all physicochemical water quality standards. In this table the Ukraine national drinking water standard for piped water is applied as threshold. For certain water source types different standards may apply as specified below. Ukraine national drinking water standard for iron is ≤ 0.2 mg/L for piped water. For wells and springs the national standard is ≤ 1.0 mg/L, which may also be granted exceptionally for piped water in selected areas. In the table above only water with iron ≤ 0.2 mg/L is considered to meet the national standard. There is no health-based guideline by the WHO for iron in drinking water. However, levels above 0.3 mg/L stain laundry and plumbing fixtures. In addition, taste and reddish-brown colour of the water caused by iron might be objectionable to users. Ukraine national drinking water standard for nitrate and the WHO health-based guideline value is ≤ 50 mg/L (both for NO3-). While for non-carbonated bottled drinking water a guideline value of ≤ 10 mg/L applies in Ukraine, the table above considers nitrate ≤ 50 mg/L to meet the national standard. Nitrate is of concern because of its link to methemoglobinemia or 'blue-baby' syndrome for bottle-fed infants. Nitrate is derived from human activities, particularly from the disposal of human and animal wastes and the use of inorganic fertilisers in agriculture.

Ukraine national drinking water standard for colour is ≤ 20 TCU for piped water. For wells and springs the national standard is ≤ 35 TCU, which may also be granted exceptionally for piped water in selected areas. The standard for bottled drinking water is ≤ 10 TCU. In the table above water with ≤ 20 TCU is considered to meet the national standard. There is no health-based guideline by the WHO for colour in drinking water. However, most people can detect colour above 15 TCU in a glass of water and may not be acceptable to consumers. Ukraine national drinking water standard for turbidity is ≤ 1 NTU for piped water. For wells and springs the national standard is ≤ 3.5 NTU, which may also be granted exceptionally for piped water in selected areas. The standard for bottled drinking water is ≤ 0.5 NTU. In the table above water with ≤ 1 NTU is considered to meet the national standard. There is no health-based guideline value by the WHO, but a recommendation to keep turbidity below 1 NTU for disinfection and aesthetic purposes. If not possible, the aim should be to keep turbidity below 5 NTU.

Table WS.1.12_SS presents the percentage of household members whose drinking water contains different concentrations of free residual chlorine at the point of collection, by selected household characteristics. Ukraine national drinking water standard for free residual chlorine is ≤ 0.5 mg/L with a recommendation to keep concentrations at 0.3 - 0.5 mg/L for network protection. For bottled drinking water the standard is ≤ 0.05 mg/L. The WHO recommends ≥ 0.2 mg/L at the point of delivery for piped supplies, or at the point of use. The WHO health-based guideline value is 5 mg/L, however consumers typically reject chlorinated water if free residual chlorine is ≥ 0.5 mg/L.

Table WS.1.13_SS summarises the availability, accessibility and quality of drinking water, presenting the key indicators from the preceding tables in this section together.

Table WS.1.1: Use of improved and unimproved water sources

Percent distribution of household members by main source of drinking water and percentage of household members using improved drinking water sources, Ukraine MICS, 2025-26

	Main source of drinking water

[1] MICS indicator WS.2 - Use of at least basic drinking water services; SDG Indicators 1.4.1 & 6.1.1

[2] MICS indicator WS.2a - Use of improved drinking water sources on premises; SDG Indicator 6.1.1

[A] Water on premises are water sources that are either 1) water piped into dwelling, yard, or plot, or 2) water from other sources reported to be located in the dwelling yard or plot, or where household members do not collect water. This excludes piped to neighbour, public tap/standpipe, and water kiosk which by definition are off-premises.

[1] As collected in the Water Quality Testing Form; may be different than the main drinking water source collected in the Household Questionnaire.

[2] In this table the Ukraine national drinking water standard for piped water is applied as threshold. For certain water source types different standards may apply as specified in [A, B, C, D]

[A] Ukraine national drinking water standard for iron is ≤ 0.2 mg/L for piped water. For wells and springs the national standard is ≤ 1.0 mg/L, which may also be granted exceptionally for piped water in selected areas. In the table above only water with iron ≤ 0.2 mg/L is considered to meet the national standard. There is no health-based guideline by the WHO for iron in drinking water. However, levels above 0.3 mg/L stain laundry and plumbing fixtures. In addition, taste and reddish-brown colour of the water caused by iron might be objectionable to users.

[B] Ukraine national drinking water standard for nitrate and the WHO health-based guideline value is ≤ 50 mg/L (both for NO3-). While for non-carbonated bottled drinking water a guideline value of ≤ 10 mg/L applies in Ukraine, the table above considers nitrate ≤ 50 mg/L to meet the national standard. Nitrate is of concern because of its link to methemoglobinemia or 'blue-baby' syndrome for bottle-fed infants. Nitrate is derived from human activities, particularly from the disposal of human and animal wastes and the use of inorganic fertilisers in agriculture.

[C] Ukraine national drinking water standard for colour is ≤ 20 TCU for piped water. For wells and springs the national standard is ≤ 35 TCU, which may also be granted exceptionally for piped water in selected areas. The standard for bottled drinking water is ≤ 10 TCU. In the table above water with ≤ 20 TCU is considered to meet the national standard. There is no health-based guideline by the WHO for colour in drinking water. However, most people can detect colour above 15 TCU in a glass of water and may not be acceptable to consumers.

[D] Ukraine national drinking water standard for turbidity is ≤ 1 NTU for piped water. For wells and springs the national standard is ≤ 3.5 NTU, which may also be granted exceptionally for piped water in selected areas. The standard for bottled drinking water is ≤ 0.5 NTU. In the table above water with ≤ 1 NTU is considered to meet the national standard. There is no health-based guideline value by the WHO, but a recommendation to keep turbidity below 1 NTU for disinfection and aesthetic purposes. If not possible, the aim should be to keep turbidity below 5 NTU.

Second	13.3	85.1	0.1	1.6	296
Middle	16.9	79.5	3.6	0.0	236
Fourth	8.3	86.3	4.2	1.2	360
Richest	20.1	70.4	0.6	9.0	319

[1] As collected in the Water Quality Testing Form; may be different than the main drinking water source collected in the Household Questionnaire.

[A] Ukraine national drinking water standard for free residual chlorine is ≤ 0.5 mg/L with a recommendation to keep concentrations at 0.3 - 0.5 mg/L for network protection. For bottled drinking water the standard is ≤ 0.05 mg/L. The WHO recommends ≥ 0.2 mg/L at the point of delivery for piped supplies, or at the point of use. The WHO health-based guideline value is 5 mg/L, however consumers typically reject chlorinated water if free residual chlorine is ≥ 0.5 mg/L.

10.2 Handwashing

Hygiene is multi-faceted and can comprise many behaviours, including handwashing, food hygiene, and menstrual hygiene. Handwashing with water and soap is the most cost-effective health intervention to reduce both the incidence of diarrhoea and pneumonia in children under five.[128] It is most effective when done using water and soap after visiting a toilet or cleaning a child, before eating or handling food and before feeding a child. Direct observation of handwashing behaviour at these critical times is challenging. A reliable alternative to observations is assessing the likelihood that correct handwashing behaviour takes place by asking to see the place where people wash their hands and observing whether water and soap (or other local cleansing materials) are available at this place.[129]

Handwashing facilities may be located within the dwelling, yard, or plot. They may be fixed or mobile and include a sink with tap water, buckets with taps, tippy-taps, and jugs or basins designated for handwashing. Soap includes bar soap, liquid soap, powder detergent and soapy water but does not include ash, mud, soil, sand, or other handwashing agents.

Hygiene has been included in the SDG targets which aim to achieve universal access to a basic hygiene service (SDG 1.4 and 6.2). Households that have a handwashing facility with both soap and water available at home meet the SDG standard for a 'basic' hygiene service. Table WS.2.1 shows the distribution of household members with fixed or mobile handwashing facilities observed at home (in the dwelling, yard, or plot). It also shows the proportion of handwashing facilities where water and soap were observed.

Table WS.2.2 presents the distribution of household members by presence of bathing facility within the dwelling, yard, or plot and elsewhere and distribution of household members with bathing facility on premises with water available.

[1] MICS indicator WS.701 - Bathing facility on premises with water

( ) Figures that are based on 25–49 unweighted cases

10.3 Sanitation

Unsafe management of human excreta and poor personal hygiene are closely associated with diarrhoea as well as parasitic infections, such as soil transmitted helminths (worms). Improved sanitation and hygiene can reduce diarrhoeal disease by more than a third[130], and can substantially reduce the health impact of soil-transmitted helminth infection and a range of other neglected tropical diseases[131].

The SDG targets relating to sanitation aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.2) in households.

Table WS.3.1 shows the percent distribution of household members using improved and unimproved sanitation facilities. An `improved sanitation facility' is defined as one that hygienically separates human excreta from human contact. Improved sanitation facilities include flush and pour-flush toilets connected to piped sewer system, to septic tanks, to pit/cesspool and to don't know where. Also ventilated improved pit (VIP) latrines, pit latrines with slabs (constructed from materials that are durable and easy to clean) and composting toilets, including twin pit latrines with slabs and container-based systems. `Unimproved sanitation facilities' are flush and pour-flush toilets or latrines flushed to open drain, pit latrines without slabs, open pits, bucket latrines (pans, trays, or other unsealed containers). Defecation in the bush, field or ditch is categorised as 'open defecation' and considered as `no facility'. Except flush and pour-flush toilets connected to sewers (which is 'networked sanitation'), all other improved and unimproved sanitation facilities listed earlier are `on-site sanitation facilities'.

Table WS.3.1A_SS summarises the types of sanitation facilities used by household members, which are presented in Table WS.3.1.

Table WS.3.2 shows the percentage of household members using water-based improved on-site sanitation facilities, including flush to septic tank and flush to pit/cesspool, with an outlet pipe from which liquid wastes are contained (wastes discharge to a leach field, soak pit or a sewer/closed drain leading to a wastewater treatment plant or don't know where) or not contained (wastes discharge to an open drain, a waterbody/surface, or other place).

Table WS.3.3 shows the percent distribution of household members using improved and unimproved on-site sanitation facilities from which excreta have been released to the surface environment due to adverse events where the facility overflowed, flooded or the containment collapsed, and are therefore categorised as not contained.

Table WS.3.4 presents the percentage of household members using flush to septic tank, pit/cesspool and other improved on-site sanitation facilities with liquid waste contained and without excreta released to surface environment due to adverse events, and therefore adequately contain waste.

Table WS.3.5 shows the percentage of household members using different methods for emptying and removal of excreta from septic tanks and other improved on-site sanitation facilities. Excreta from septic tanks and other improved on-site sanitation facilities that is never emptied (or don't know if ever emptied), not emptied but covered and left undisturbed when full, or is emptied and buried in a covered pit is classed as 'safe emptying and disposal in situ' and meets the SDG criteria for a 'safely managed' sanitation service. Excreta from improved pit latrines and septic tanks that is removed off-site for treatment (type of treatment unknown) may also be safely managed, depending on the type of treatment received. Other methods of emptying and removal are not considered 'safely managed'.

Table WS. 3.7 presents the percent distribution of household members using improved and unimproved sanitation facilities which are private, shared with other households or public facilities. Those using shared or public improved sanitation facilities are classed as having a 'limited' service for the purpose of SDG monitoring. Households using improved sanitation facilities that are not shared with other households meet the SDG criteria for 'at least basic' sanitation services and may be considered 'safely managed' depending on how excreta are managed.

Table WS.3.8 presents the percent distribution of household members using improved sanitation facilities, including shared and inadequately contained and excluding shared and inadequately contained, with safe disposal in situ, unsafe disposal of excreta and with excreta removed offsite for treatment. Households using improved on-site sanitation facilities

[130] Cairncross, S. et al. "Water, Sanitation and Hygiene for the Prevention of Diarrhoea." International Journal of Epidemiology39, no. Suppl1 (2010): 193-205. doi:10.1093/ije/dyq035.

[131] WHO. Water, sanitation and hygiene for accelerating and sustaining progress on Neglected Tropical Diseases. A Global Strategy 2015-2020. Geneva: WHO Press, 2015. http://apps.who.int/iris/bitstream/handle/10665/182735/WHO_FWC_WSH_15.12_eng.pdf;jsessionid=7F7C38216E04E69E7908AB6E8B63318F?sequence=1.

(excluding those which are shared and inadequately contained) from which excreta are safely disposed of in situ are considered safely managed. Those practising open defecation, using unimproved sanitation facilities or improved sanitation facilities that are shared or inadequately contained are not safely managed. Households using improved facilities (excluding shared and inadequately contained) with excreta removed off-site for treatment additional may be safely managed depending on the type of treatment received (additional information required).

The JMP has produced regular estimates of national, regional, and global progress on drinking water, sanitation, and hygiene since 1990. The JMP service 'ladders' enable benchmarking and comparison of progress across countries at different stages of development. Since 2015, drinking water, sanitation and hygiene ladders have been used to report WASH relevant SDG indicators. Table WS.3.9 summarises the percentages of household members meeting the SDG criteria for 'at least basic' drinking water, sanitation, and hygiene services ('at least basic' includes 'basic' and higher service levels). The percentage of household members meeting the SDG 6.1 criteria for safely managed drinking water is shown as a separate column. While MICS surveys provide information on the percentage of household members using improved on-site sanitation facilities with safe emptying and disposal in situ and with excreta removed off-site, additional information on off-site treatments is needed to calculate the percentage meeting the SDG 6.2 criteria for safely managed sanitation services.

Table WS.3.1: Use of improved and unimproved sanitation facilities

Percent distribution of household members by type of sanitation facility used by the household, percentage of household members using improved sanitation and percentage using on-site sanitation facilities, Ukraine MICS, 2025-26

	Type of sanitation facility used by household												Open defecation (no facility, bush, field)	Missing	Total	Percentage using improved sanitation[1]	Percentage using on-site sanitation facilities[A]		Number of household members
	Improved sanitation facility								Unimproved sanitation facility

[1] MICS indicator WS.6 - Use of safely managed drinking water services; SDG Indicator 6.1.1

[2] MICS indicator WS.2 - Use of basic drinking water services; SDG indicators 1.4.1 & 6.1.1

[3] MICS indicator WS.9 - Use of basic sanitation services; SDG indicators 1.4.1 & 3.8.1 & 6.2.1

[A] Safely managed drinking water service is included in the drinking water distribution as part of "at least basic service". The column is available only in surveys that included water quality measurements.

[B] A safely managed sanitation service refer to the treatment of waste both in-situ and off-site. While MICS provides detailed information on safely disposed in situ treatment, only national regulatory assessments can provide relevant details on off-site treatments. Therefore MICS data alone are not sufficient to estimate SDG 6.2.1 for safely managed sanitation services but provides estimates for 'Safely managed service (safely disposed of in situ only)'.

C For the purposes of calculating the ladders, 'No permission to see / other' is included in the denominator.

[D] Differs from the MICS Indicator WS.7 'Handwashing facility with water and soap at home' (SDG indicators 1.4.1 & 6.2.1) as it includes 'No permission to see / other'. See Table WS2.1 for MICS indicator WS.7.

( ) Figures that are based on 25–49 unweighted cases

11. Equitable chance in life

11.1 Child functioning

The Convention on the Rights of Persons with Disabilities[132] outlines States Parties' obligations to ensure the full realisation of rights for children with disabilities on an equal basis with other children. The presence of functional difficulties may place children at risk of experiencing limited participation in an unaccommodating environment and limit the fulfilment of their rights.

2025-26 Ukraine MICS included child functioning modules developed by UNICEF and the Washington Group on Disability Statistics intended to provide an estimate of the number/proportion of children with functional difficulties as reported by their mothers or primary caregivers. It conforms to the biopsychosocial model of disability, focusing on the presence and extent of functional difficulties rather than on body structure or conditions. The module included in the Questionnaire for Children Under Five covered children between 2 and 4 years of age while a similar module is also included in the Questionnaire for Children Age 5-17.

Functional domains covered in Questionnaire for Children Under Five are as follows: seeing, hearing, walking, fine motor, communication, learning, playing, and controlling behaviour while functional domains covered in Questionnaire for Children Age 5-17 are as follows: seeing, hearing, walking, self-care, communication, learning, remembering, concentrating, accepting change, controlling behaviour, making friends, anxiety, and depression.

Tables EQ.1.1 and EQ.1.2 present the percentage of children by age group with functional difficulty by domain.

Table EQ.1.3 presents the percentage of children age 2-17 who use assistive devices and still have difficulty within the relevant functional domains.

Table EQ.1.4 is a summary table presenting the percentage of children by age group with functional difficulty.

Table EQ.1.1: Child functioning (children age 2-4 years)

Percentage of children age 2-4 years with functional difficulties, by domain, Ukraine MICS, 2025-26

	Percentage of children aged 2-4 years who have functional difficulties[A] in the domains of:

[A] Functional difficulty for children age 2-4 years are defined as having responded "A lot of difficulty" or "Cannot at all" to questions within all listed domains, except the last domain of controlling behaviour, for which the response category "A lot more" is considered a functional difficulty.

[B] Children age 2 are excluded, as preschool attendance is only collected for age 3-4 years.

[C] The disaggregate of Mother's functional difficulties is shown only for respondents to the Adult Functioning module, i.e., individually interviewed women age 18-49 years in selected households.

( ) Figures that are based on 25–49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

11.2 Discrimination and harassment

Discrimination can impede individuals from accessing opportunities and services in a fair and equal manner. These questions are designed to measure the experiences of discrimination and harassment of respondents in the 12 months before the survey. The questions include specific grounds of discrimination and harassment which can increase the respondents' recall of events. The current questions are based on a recommended set of questions available at the start of MICS6. The questions may change given that methodological development is currently underway to move the indicator from a Tier III SDG indicator classification to Tier II. Table EQ.3.1W_SS shows the percentage of women who felt discriminated against based on a number of grounds.

Table EQ.3.1W_SS: Discrimination and harassment

Percentage of women age 15-49 years who in the past 12 months have felt discriminated against or harassed, by grounds, and perentage who have not felt discriminated against or harassed, Ukraine MICS, 2025-26

11.3 Reproductive agency

Table EQ.5.1 presents the percentage of women aged 15-49 years (married or in union) who make their own decision on all three selected areas i.e. decide on their own health care; decide on use of contraception; and can say no to sexual intercourse with their husband or partner if they do not want. Only women who provide a "yes" answer to all three components are considered as women who make their own decisions regarding sexual and reproductive health.

Table EQ.5.1: Informed decisions regarding sexual relations, contraceptive use, and reproductive health care

Percentage of currently married/in union women age 15-49 years who make their own informed decisions regarding sexual relations, contraceptive use and health care, Ukraine MICS, 2025-26

	Percentage of women currently married or in union who				Number of women currently married or in union
	Usually make specific decisions either alone or jointly with their husband about her health care[A]	Usually make specific decisions either alone or jointly with their husband to use or not use family planning	Can say no to their husband if they do not want to have sexual intercourse	Make all three listed decisions[1]

[1] MICS Indicator EQ.704 - Decision-making on reproductive health; SDG indicator 5.6.1

[A] This column is based on question DM3 in the Questionnaire for Women: Who usually makes decisions about health care for yourself? Women who respond that they themselves make decisions or that decisions are made jointly with their husband/partner are in the numerator. The survey asked a second question (DM4): Can you also please tell me, who takes the decision on when you can go to seek reproductive health care; for example, if you experience a painful or burning sensation when urinating? This question is not tabulated both is available in the data and can be analysed further.

12. Post-emergency

The Post-Emergency module is designed to measure the impact of an emergency on households. It is used to capture the consequences of a specific emergency event or period, including demographic changes, direct health effects, economic losses or shocks to livelihoods, and disruptions to or loss of essential services. The module is intended to provide information on the impact of emergencies on household composition, well-being, and access to basic necessities.

In the 2025-26 Ukraine MICS, the Post-Emergency module was customised to reflect the context of Russia's full-scale invasion of Ukraine, which began on 24 February 2022 and was still ongoing at the time the survey was conducted. Due to the prolonged and evolving nature of the emergency, the module does not measure a completed post-crisis situation. Instead, it captures selected household-level impacts experienced since the beginning of the invasion up to the time of the interview.

It focuses on a defined set of measurable consequences, including the displacement of household members; the hosting of individuals who joined the household due to the invasion; housing damage or destruction; deaths; illness or injury among household members; household member separation; education and essential service disruptions; changes in household income; and damage, destruction or loss of valuable household items.

The reference period for all questions is from 24 February 2022 until the time of the interview. Therefore, the indicators presented in this chapter represent cumulative household reports of selected impacts experienced at any point during this ongoing period. They should be interpreted as a structured overview of the specific household-level effects covered by the module rather than as an exhaustive assessment of all the consequences of the war or an indication of the current situation only.

Table PE.1 presents information on demographic changes due to the full-scale invasion. It includes the percentage of households that were displaced due to the full-scale invasion, percentage of households that hosted displaced persons during the period of the full-scale invasion, percent distribution of displaced households by time away, percent distribution of number of persons hosted, percentage of households with one or more members deceased due to the full-scale invasion, percentage of households with one or more separated members due to the full-scale invasion and percentage of households affected by demographic changes.

Table PE.2 presents information on selected direct health effects of the full-scale invasion among household members. It includes whether any household member became seriously ill due to the full-scale invasion or became injured due to the full-scale invasion.

Table PE.3 presents information on households affected by economic and livelihood losses due to the full-scale invasion, such as loss of income, assets or damage to their homes. Table PE.4 presents the distribution of households that experienced income losses as a result of the full-scale invasion, categorised by the reasons underlying these losses.

Table PE.5 shows the percentage of households that experienced disruption to their access to water, sanitation, education and healthcare services as a result of the full-scale invasion. Disaggregation by the presence of children in the household is based on the household's status at the time of the interview. However, the indicator "Percentage of households with school-going children aged 5–17 years who stopped attending school due to the full-scale invasion" refers to any point in time since the start of the full-scale invasion. Therefore, there is a temporal mismatch between the household status used for disaggregation and that used for the indicator. This should be taken into account when interpreting the results.

Table PE.6 summarises the overall effect of full-scale invasion on households, covering demographic changes, health effects, economic or livelihood shocks, and loss of essential services.

Table PE.1: Demographic changes due to the emergency

Percentage of households that were displaced due to the full-scale invasion, percentage of households that hosted displaced persons during the period of the full-scale invasion, percent distribution of displaced households by time away, percent distribution of number of persons hosted, percentage of households with one or more members deceased due to the full-scale invasion, percentage of households with one or more separated members due to the full-scale invasion and percentage of members affected by demographic changes, Ukraine MICS, 2025-26

[1] MICS Indicator PE.701a - Households affected by emergency (all households)

(*) Figures that are based on fewer than 25 unweighted cases

Appendix A. Sample design

The major features of the sample design are described in this appendix. Sample design features include defining the sampling frame, target sample size, sample allocation, listing in sample clusters, choice of domains, sampling stages, stratification, and the calculation of sample weights.

The primary objective of the sample design for the 2025-26 Ukraine MICS was to produce statistically reliable estimates of most indicators, at the national level, for urban and rural areas, and for 24 regions. For presentation in this report, regional results are aggregated into five macroregions, using the same grouping as in the 2012 Ukraine MICS to support comparison over time. The macroregions were formed by regrouping 24 administrative regions (the Government controlled areas only) of Ukraine:

- North macroregion includes the Kyiv city, and Kyiv, Zhytomyr, Sumy, Chernihiv oblasts;
- West macroregion includes Ivano-Frankivsk, Khmelnytskyi, Chernivtsi, Lviv, Rivne, Ternopil, Volyn, and Zakarpattia oblasts;
- Center macroregion includes Cherkasy, Poltava, Kirovohrad, Vinnytsia oblasts;
- East macroregion includes Dnipropetrovsk, Donetsk, Luhansk, Zaporizhia, Kharkiv oblasts;
- South macroregion includes the Autonomous Republic of Crimea, Sevastopol city, and Odesa, Mykolaiv, Kherson oblasts.

Results from the 2025–26 survey relate only to territories covered by the survey and do not represent temporarily occupied territories or other areas excluded from the sampling frame because of security and access constraints.

For security reasons, the sample frame covered only government-controlled territory and areas where it was feasible to conduct the survey in terms of security. Therefore, the following were excluded from the sample frame: the Luhansk region (East macroregion), the Autonomous Republic of Crimea and the city of Sevastopol (South macroregion), and hromadas bordering the front line and Russian Federation (with the exception of Kherson city, which was included). Urban and rural areas in each of the 24 regions were defined as the sampling strata, resulting in 46 strata as the Kherson city and Kyiv city have no rural areas. In designing the sample for the 2025-26 Ukraine MICS, it was useful to review the sample design and results of the MICS conducted in 2012, documented in the Final Report of that survey.

A multi-stage, stratified cluster sampling approach was used to select the survey sample. In the absence of a recent population census, the sampling frame was developed by combining population estimates and administrative data from several sources. The principal source for population totals and their distribution by age and sex was the UNFPA Common Operational Dataset on Population Statistics (COD-PS), which provided estimates at national, regional and district levels (as updated in September 2024). These estimates were further disaggregated geographically using population estimates based on mobile-operator data and supplementary administrative data from the National Health Service of Ukraine, the State Register of Voters and the Institute of Educational Analytics. Data from the 2023-24 Household Socio-Economic Status Survey[133] were used to estimate average household size and household composition by region and type of area and to convert population estimates into estimated numbers of households. Permanent VAs and the settlements belonging to them provided the territorial basis for defining the primary sampling units. The resulting estimated number of households in each unit was used as the measure of size for sample selection.

The primary sampling units (PSUs) corresponded to one voting area or one settlement to which the voting area belongs – for the first stage sample selection.

At the first stage, a VA, or a pre-defined part of a VA (where this was possible), was selected systematically within each sampling stratum with probability proportional to its estimated number of households. Where a selected unit contained fewer than 70 estimated households, it was combined with an adjacent area to form a larger unit of approximately 120 households. Where a selected PSU contained more than 350 estimated households, it was divided into compact segments of approximately 120 households, and one segment was selected with probability proportional to its estimated number of households. The resulting territorial unit constituted the survey cluster. Approximately 80 per cent of the selected PSUs required additional segmentation.

At the second stage, a complete household listing was conducted in each selected cluster. Listed households were classified into two listing categories: households with at least one child under age five and households without children under age five. A systematic sample of 24 households was selected in each cluster. Up to 12 households were selected from the category of households with children under age five, with the remaining households selected from the category of households without children under age five. Where fewer than 12 households with children under age five were listed,

[133] https://knowledge.unicef.org/resource/socio-economic-status-households-ukraine

all such households were selected and the balance was selected from households without children under age five. This oversampling strategy increased the number of young children in the sample and improved the precision of estimates for children under age five.

Under this probability sampling design, each household and household member had a known, non-zero probability of selection once the household listing and household-member roster were completed. Sample weights based on the inverse of the overall selection probabilities, with appropriate adjustments for non-response, were used to produce statistically valid estimates for the survey population and relevant population subgroups.

A.1 Sample size and sample allocation

Since the overall sample size for the 2025-26 Ukraine MICS partly depends on the geographic domains of analysis that are defined for the survey tables, the distribution of PSUs, and households in Ukraine was first examined by region, urban and rural strata, shown in Table SD.1.

Table SD.1: Distribution of PSUs and households in sampling frame

Distribution of PSUs and households, by region, urban and rural strata

	Number of PSUs			Number of households (2025 estimates)		
	Total	Urban	Rural	Total	Urban	Rural

Kyiv city	1,041	1,041	–	1,597,909	1,597,909	–

The overall sample size for the 2025-26 Ukraine MICS was calculated as 24,000 households.

Usually, the MICS sample size is based on an indicator that characterizes a relatively uncommon phenomenon (with values ranging from 10% to 40%). Calculations are made for small population groups, for example children aged 0–4 years, children aged 12–23 months and women aged 15–49 years who have given birth in the last two years. This approach

ensures reliable estimates for the smallest target group, which in turn ensures reliable estimates for the vast majority of other indicators.

As data for the smallest target populations was missing or outdated, it could not be used for the standard approach. Therefore, a theoretical indicator was used instead.

Since the survey results are tabulated at the regional level, it was necessary to determine the minimum sample size for each region. The following formula was used to estimate the required sample size for this indicator:

$$n = \frac{[4(r)(1-r)(deff)]}{[(RME \times r)^2(pb)(AveSize)(RR)]}$$

where:

n = the required sample size, expressed as number of households

4 = a factor to achieve the 95 percent level of confidence

r = the predicted or anticipated value of the indicator, expressed in the form of a proportion

deff = the design effect for the indicator, estimated from a previous survey or using a default value of 2

RME = the relative margin of error of *r* to be tolerated at the 95 percent level of confidence; it is generally not more that 0.12 (12 percent) for national-level estimates

pb = the proportion of the total population upon which the indicator, *r*, is based

AveSize = the average household size (mean number of persons per household)

RR = the predicted response rate

Some of the key MICS indicators are for children under the age of 5 years. Given the relatively low fertility rate and smaller average household size in Ukraine, it is important to ensure that the number of children under 5 years in the sample is sufficient to provide reliable results. In order to avoid a large increase in the number of sample households to provide a sufficient number of sample children under 5, it was more cost-effective to increase the sampling rate for households found to have at least one child under 5 during the listing. Based on this sampling strategy described below, it is estimated that 0.2 of the sample population will be under the age of 5 years. In using the formula above for calculating the sample size, the adjusted value of 0.2 was used for *pb* to account for the oversampling of households with children under 5, and this will reduce the required number of sample households.

For the calculation, *r* was assumed to be 25 percent (for frontline regions – Donetsk, Zaporizhia, Kherson – r was assumed to be 40 percent). The value of *deff* (design effect) was taken as 2.0 based on the estimate from the MICS 2012, *pb* (expected percentage of children age 0-4 years in the total sample population) was taken as 20 percent (as described above), *AveSize* (mean household size) was taken from 1.3 to 2.8 persons per household and depending on the region. The response rate was assumed to be from 60 to 75 percent depending on the region. Although an *RME* of 12% is needed for the national-level estimates, for the regional-level estimates it was sufficient to use a higher *RME* of 20% (that is, a margin of error of 0.20 *r*). To achieve a target of approximately 300 children under five per region, wan oversampling strategy of households with under-five children was applied across all regions. Exceptions were made for Donetsk, Zaporizhzhia, and Kherson, where the estimated number of under-five children was around 100. Accordingly, sample sizes for each of the 24 regions were calculated to range between 576 and 1,248 households.

The number of households selected per cluster for the 2025-26 Ukraine MICS was determined as 24 households, based on several considerations, including the design effect, the budget available, and the time that would be needed per team to complete one cluster. Dividing the total number of households by the number of sample households per cluster, it was calculated that 1000 sample clusters would need to be selected. The clusters were distributed by region based on the number of households and the number of households with children under 5 years of age.

In each region, the clusters (PSUs) were distributed to the urban and rural strata proportionally to the number of households in the frame for each stratum within that region. Table SD.2 shows the allocation of the sample clusters and households to the sampling strata

Table SD.2: Sample allocation

Allocation of sample clusters and sample households to sampling strata, MICS Ukraine 2025-26

	Sample Clusters			Sample Households		
	Total	Urban	Rural	Total	Urban	Rural
Total	1000	634	366	24,000	14,808	9,192

A.2 Selection of clusters

Clusters were selected from each of the sampling strata by using systematic probability proportional to size (PPS) sampling procedures, based on the number of households in each cluster from the sample frame. Prior to the first stage sample selection, the PSUs in the sampling frame for each stratum were ordered geographically by administrative area in order to provide additional implicit stratification. The first stage of sampling was thus completed by selecting the required number of clusters (specified in Table SD.2) from each of the 24 regions, separately for the urban and rural strata.

As noted, a segmentation procedure was applied in large PSUs. For PSUs with more than 350 households, segments of approximately 120 households were created. Subsequently, one segment was selected using PPS as the second stage of sampling within each large PSU.

A.3 Listing activities

For the 2025-26 Ukraine MICS a listing of households was conducted in all the sampled clusters prior to the selection of households. For this purpose, listing teams were trained to visit all the selected clusters and list all households in each cluster. The listing included a question on whether the household has a child under the age of 5 years. This was used to stratify the listing for each cluster into households with and without a child under 5, as described below.

Training for the household mapping and listing operation was conducted for 5 days in July, 2025. Training included lectures and field practice in urban, semi-urban and rural areas of Kyiv city and Kyiv region. The training agenda and content was based on the template MICS Manual for Mapping and Household Listing[134].

The household listing exercise was compiled using the CAPI application developed by the country team, which duplicates the standard MICS listing form. Printed paper maps of selected areas were used for mapping. Listing and mapping took no longer than two months for each region. The work was launched in waves across regions and took place between July and November 2025.

A.4 Selection of households

Based on the mapping and listing operation, lists of households were prepared for each sample cluster. The households listed in each sample cluster were divided into two strata for the second stage selection: households with children under age 5 and households without children under 5. A separate sample of households was selected from each group, using a higher sampling rate for households with children under 5. This sampling strategy increased the number of children under 5 in the sample to improve the precision of the indicators based on under-5 children.

Of the 24 households selected in each cluster, the target number of sample households with children under age 5 years was 12. Therefore, in sample clusters where more than 12 households with children under age 5 were listed, 12 of these households were selected using random systematic sampling; and 12 households without children under age 5 were selected from the other stratum. In sample clusters where 12 or less households with children under 5 were listed, all of these households were selected for the survey. In these clusters, the number of households without children under 5 to be selected was equal to 24 minus the number of households with children. Within each stratum the sample households were selected using random systematic sampling. The MICS Systematic Random Selection of Households Template[6] was adapted for this purpose.

The 2025-26 Ukraine MICS also included water quality testing and water quality lab testing for a subsample of households within each sample cluster. A subsample of 5 of the 24 selected households was sampled in each sample cluster using random systematic sampling for conducting water quality testing, for water in the household and at the source, and water at the source for lab testing. The MICS household selection template includes an option to specify the number of households to be selected for the water quality testing, and the spreadsheet automatically selected the corresponding subsample of households.

A standard quality control measure was implemented through blank testing (a test of uncontaminated water) to assess whether teams were correctly performing the water testing procedure. One blank test was assigned to each cluster, but for practical purposes relating to data capture, this was assigned to the first household number selected for water quality testing.

A.5 Calculation of sample weights

The 2025-26 Ukraine MICS sample is not self-weighting. Essentially, by allocating a similar number of households to each of the regions, different sampling fractions were used in each region since the number of households in the sample frame varies by region. Within each sample cluster, different sampling rates were also used for selecting the households with and without children under 5. For these reasons, sample weights were calculated separately for the households with and without children under 5 in each sample cluster and used in the subsequent analyses of the survey data.

The major component of the weight is the reciprocal of the sampling fraction employed in selecting the number of sample households in that particular sampling stratum (*h*) and PSU (*i*):

$$\mathrm{W_{hi}} = \frac{1}{\mathrm{f_{hi}}}$$

The term f_{hi}, the sampling probability for the households in the *i*-th sample PSU in the *h*-th stratum, is the product of the probability of selection at every stage in each sampling stratum:

$$\mathrm{f_{hi}} = \mathrm{p_{1hi}} \times \mathrm{p_{2hi}} \times \mathrm{p_{3hi}}$$

[134] https://mics.unicef.org/tools#survey-design

where p_{shi} is the probability of selection of the sampling unit at stage *s* for the *i*-th sample PSU in the *h*-th sampling stratum. Based on the sample design, these probabilities were calculated as follows:

$$p_{1hi} = \frac{n_h \times M_{hi}}{M_h},$$

where:

n_h = number of sample PSUs selected in stratum *h*
M_{hi} = number of households in the sample frame for the *i*-th sample PSU in stratum *h*
M_h = total number of households in the sample frame for stratum *h*
p_{2hi} = proportion of the PSU listed in the *i*-th sample PSU in stratum *h* (in the case of PSUs that were segmented); for non-segmented PSUs, $p_{2hi} = 1$

Within each sample PSU the last stage probability p_{3hi} will vary for the households with and without children under 5 years, given that a separate sample was selected for each group. For this reason, separate weights were calculated for each group of households in the sample PSU.

Based on the stratified two-stage sample design, the probability of selection for the sample households with children under 5 within a sample EA was calculated as follows:

$$f_{hi(wc)} = \frac{n_h \times M'_{hi}}{M_h} \times p_{2hi} \times \frac{m_{hi(wc)}}{M'_{hi(wc)}}$$

where:

$f_{hi(wc)}$ = probability of selection for the sample households with children under 5 in the *i*-th sample PSU in stratum *h*
n_h, M_{hi}, M_h and p_{2hi} are identical to the definition above
$m_{hi(wc)}$ = number of sample households with children under 5 selected in the *i*-th sample PSU in stratum *h*
$M'_{hi(wc)}$ = total number of households with children under 5 listed in the *i*-th sample PSU in stratum *h*

The corresponding overall probability of selection for the households without children was calculated as follows:

$$f_{hi(woc)} = \frac{n_h \times M'_{hi}}{M_h} \times p_{2hi} \times \frac{m_{hi(woc)}}{M'_{hi(woc)}}$$

where:

$f_{hi(woc)}$ = probability of selection for the sample households without children under 5 in the *i*-th sample PSU in stratum *h*
$m_{hi(woc)}$ = number of sample households without children under 5 selected in the *i*-th sample PSU in stratum *h*
$M'_{hi(woc)}$ = total number of households without children under 5 listed in the *i*-th sample PSU in stratum *h*

A final component in the calculation of sample weights takes into account the level of non-response for the household and individual interviews by stratum, as well as the sample cluster completion rate for each stratum. The adjustment for the cluster and household non-response in each stratum is equal to:

$$\frac{n_h}{n'_h} \times \frac{1}{RR_h}$$

where RR_h is the response rate for the sample households in stratum *h*, defined as the proportion of the number of interviewed households in stratum *h* out of the number of selected households found to be occupied during the fieldwork in stratum *h*. The term n'_h is the number of sample clusters with complete enumeration in stratum *h*, so the first adjustment factor corresponds to the inverse of the sample cluster completion rate for stratum *h*. This additional adjustment factor is needed in the case where some sample clusters cannot be enumerated in some strata due to security or accessibility problems. In the case where all the sample clusters in each stratum are enumerated, this cluster adjustment factor is equal to 1 for all strata, so it does not affect the weight. This adjustment of the household weight based on the cluster completion rate is included in the corresponding formulas in the MICS template for calculating the weights.

Similarly, adjustment for non-response at the individual level (women, and under-5 children) for each stratum is equal to:

$$\frac{1}{RR_{qh}}$$

where RR_{qh} is the response rate for the individual questionnaires in stratum *h*, defined as the proportion of eligible individuals (women, and under-5 children) in the sample households in stratum *h* who were successfully interviewed.

After the completion of fieldwork, response rates were calculated for each sampling stratum. These were used to adjust the sample weights calculated for each cluster. Response rates in the MICS Ukraine 2025-26 are shown in Table SR.1.1 in this report.

The non-response adjustment factors for the individual women and under-5 questionnaires were applied to the adjusted household weights. Numbers of eligible women and under-5 children were obtained from the list of household members in the Household Questionnaire for households where interviews were completed.

In the case of the questionnaire for children age 5-17 years, in each sample household, one child was randomly selected from all the children in this age group recorded in the list of household members, in effect a tertiary sampling unit. The household weight for the children age 5-17 years is first adjusted based on the response rate for this questionnaire at the stratum level. Once this adjusted household weight is normalised as described below, it is multiplied by the number of children age 5-17 years recorded in the list of household members. Therefore, the weights for the individual children age 5-17 years will vary by sample household. This weighting of the data for the children age 5-17 years old is implemented in the tabulation programs for the corresponding tables.

For the water quality testing (both in household and at source, and at source for lab testing) a subsample of 5 households was selected from the 24 MICS sample households in each sample cluster. Therefore, the basic (unadjusted) household weight would be multiplied by the inverse of this subsampling rate as follows:

$$\mathrm{W_{wqhi}} = \frac{1}{\mathrm{f_{hi}}} \times \frac{24}{5} = \frac{4,8}{\mathrm{f_{hi}}}$$

where:

W_{wqhi} = basic weight for the subsample of households selected for the water quality testing in the *i*-th sample EA in stratum h

Since the response rate may be different for the water quality testing for home consumption and at the source, the basic weights for each were adjusted separately for non-response at the stratum level as follows:

$$\mathrm{W'_{wqhi}} = \mathrm{W_{wqhi}} \times \frac{\mathrm{n_h}}{\mathrm{n'_h}} \times \frac{\mathrm{m_{wqh}}}{\mathrm{m'_{wqh}}}$$

where:

W'_{wqhi} = adjusted weight for the subsample of households selected for the water quality testing in the *i*-th sample EA in stratum *h* (separately for water quality testing in the household and at the source)

m_{wqh} = number of valid (occupied) sample households selected for water quality testing in stratum *h*

m'_{wqh} = number of sample households with completed water quality testing in stratum *h* (separately for water quality testing in the household and at the source)

As in the case of the adjustment of the raw household weights, an adjustment factor equal to the inverse of the cluster completion rate (n_h/n'_h) for the stratum is necessary to account for any sample clusters that could not be enumerated within a stratum. As mentioned above, this factor is equal to 1 for any stratum for which all the sample clusters were enumerated.

The 2025-26 Ukraine MICS full (raw) weights for the households were calculated by multiplying the inverse of the probabilities of selection by the non-response adjustment factor for each stratum. These weights were then standardised (or normalised), one purpose of which is to make the weighted sum of the interviewed sample units equal to the total sample size at the national level. Normalisation is achieved by dividing the full sample weights (adjusted for nonresponse) by the average of these weights across all households at the national level. This is performed by multiplying the sample weights by a constant factor equal to the unweighted number of households at the national level divided by the weighted total number of households (using the full sample weights adjusted for non-response). A similar standardisation procedure was followed in obtaining standardised weights for the individual women, under-5 questionnaires and water quality testing. Adjusted (normalised) household weights varied between 0.0433 and 3.8553 in the 988 sample clusters.

Sample weights were appended to all data sets and analyses were performed by weighting the data for households, women, under-5s, children and adolescents age 5-17 years, and water quality testing with these sample weights.

Appendix B. List of personnel involved in the survey

State Statistics Service of Ukraine

Arsen Makarchuk	Chairman *Head of the 2025-26 Ukraine MICS Steering Committee*
Inesa Senyk	Director of the Department for Social Statistics *2025-26 Ukraine MICS Survey Coordinator*
Olga Karmazina	Deputy Director of the Department of Social Statistics *Household survey expert, Head of the 2025-26 Ukraine MICS Technical Committee*
Andriy Gerasymenko	Deputy Director of the Department of Social Statistics and Head of the Division for Monitoring of Social Programmes and One-off Surveys *Household Survey Expert, Secretary of the 2025-26 Ukraine MICS Technical Committee*

UNICEF Ukraine

Anne-Claire Dufay	UNICEF Representative in Ukraine
Munir Mammadzade	Former UNICEF Representative in Ukraine
Sebastian Carrasco	Chief Planning & Monitoring
Andriy Gorbal	Planning & Monitoring Officer *2025-26 Ukraine MICS Focal Point*
Tetiana Lukovych	National MICS Consultant
Yuliia Vernyhor	Data Analysis and Data Use Expert MICS
Karishma Kadyan	Water & Env. Sanitation Specialist
Svitozar Nitspol	Monitoring & Evaluation Officer
Svitlana Kisilova	Social & Behavior Change Specialist
Zaman Ali Hassan	Child Protection Specialist

UNICEF Headquarters and Europe and Central Asia Regional Office

Deepak Kumar Dey	Regional Monitoring and Statistics Specialist, Programme Planning and Data Section, UNICEF Regional Office *MICS Regional Coordinator*
Siraj Mahmudlu	Planning & Monitoring Specialist, UNICEF Regional Office
Ahmet Sinan Türkyilmaz	Professor at Hacettepe University, Head of Department of Social Research Methodology, Deputy Director of Institute of Population Studies *Sampling Expert, UNICEF Regional Office*
Tijana Čomić	Assistant Professor, Fakultet organizacionih studija "Eduka", Serbia *Household Survey Expert, UNICEF Regional Office*
Nazim Gashi	GIS Expert Consultant, UNICEF Headquarters
Ikhtier Kholmatov	Data Processing Specialist, UNICEF Headquarters
Bo Robert Beshanski-Pedersen	Household Survey Expert Consultant, UNICEF Headquarters
Yadigar Coskun	Statistics and Monitoring Specialist (Data Processing), UNICEF Headquarters
Lars Osterwalder	JMP Water Quality Consultant
Maryna Peter	Group Leader WASH, FHNW, WHO consultant
Sakshi Mishra	Statistics & Monitoring Specialist, OSE - Data & Analytics
Eva Quintana	Statistics & Monitoring Manager, OSE - Data & Analytics

Steering Committee Members

Arsen Makarchuk	Chairman of the State Statistics Service of Ukraine, Head of the 2025-26 MICS Ukraine Steering Committee
Ella Libanova	Director of the Institute of Demography and Quality of Life Issues of the National Academy of Sciences of Ukraine
Iryna Suslova	Representative of the Ukrainian Parliament Commissioner for Children's Rights (Committee member by early 2026)
Lyudmyla Shemelynets	First Deputy Minister of Social Policy, Family, and Unity of Ukraine (Committee member after early 2026)
Oksana Chervyakova	Representative of the Ukrainian Parliament Commissioner for Children's Rights
Iryna Postolovska	Deputy Minister of Social Policy of Ukraine for European Integration (Committee member by early 2026)
Anastasiya Konovalova	Deputy Minister of Education and Science of Ukraine
Oleksiy Danilenko	Deputy Director General of the State Institution "Center for Public Health of the Ministry of Health of Ukraine" (Committee member by early 2026)
Tetiana Orabina	Deputy Director General of the State Institution "Center for Public Health of the Ministry of Health of Ukraine" (Committee member after early 2026)
Shameza Abdulla	Deputy Head of Program Operations, UNICEF Office in Ukraine
Sebastián Carrasco	Chief of the Planning and Monitoring Division, UNICEF Country Office in Ukraine
Yulia Bilko	Secretary of the 2025-26 Ukraine MICS Steering Committee

Technical Committee Members

Maria Sakuta	Director General of the Directorate for Overcoming Difficult Life Circumstances, Ministry of Social Policy of Ukraine (Committee member by early 2026)
Andriy Lytvinchuk	Director of the Institute of Educational Analytics, Ministry of Education and Science of Ukraine
Lyudmyla Polyanska	Head of the Statistics Section, Department of Statistics and Analysis, State Institution "Center for Public Health of the Ministry of Health of Ukraine"
Tetyana Semenyk	Deputy Director of the Department of Mass Sports and National Health – Head of the Physical Culture Monitoring Division, Ministry of Youth and Sports of Ukraine
Vladislav Yatsuk	Head of the Youth Policy Division, Ministry of Youth and Sports of Ukraine (Committee member by early 2026)
Volodymyr Khadzhinov	Acting Head of the Department of Regional Youth Policy and Support for Youth Initiatives, Directorate of Youth Policy, Ministry of Youth and Sports of Ukraine (Committee member after early 2026)
Olena Koziychuk	Chief Specialist, Water Supply and Sewerage Division, Department of Public Utilities, Ministry of Community and Territorial Development of Ukraine
Serhiy Pakholchuk	Chief Specialist of the Water Supply and Wastewater Management Division, Department of Life Support Systems, Ministry of Community and Territorial Development of Ukraine (Committee member after early 2026)
Vasyl Madyar	Head of the Directorate for Coordination and Methodological Support on Children's Rights Protection, State Service of Ukraine for Children's Affairs (Committee member by early 2026)
Alesya Avdeeva	Head of the Division for Methodological Support of Children's Rights and Interests, Directorate for Coordination and Methodological Support on Children's Rights Protection, State Service of Ukraine for Children's Affairs
Oksana Ovramenko	Director of the Department of Policies for the Protection of the Rights of Families, Children, and Their Well-Being at the Ministry of Social Policy, Family, and Unity of Ukraine
Viktor Zelenyi	Director of the Department for State Oversight of Children's Rights at the National Social Service of Ukraine
Oleksandra Khamulenko	Head of the Division for Compliance with Equality Standards at the National Social Service of Ukraine (Committee member by early 2026)
Dilyara Saitova-Yurchenko	Chief Specialist of the Accounting, Analysis, and Monitoring Department of the National Social Service of Ukraine (Committee member after early 2026)
Volodymyr Sarioglo	Head of the Division for Modeling Socioeconomic Processes and Structures at the Institute of Demography and Quality of Life Issues of the National Academy of Sciences of Ukraine
Olga Karmazina	Deputy Director of the Department of Social Statistics at the State Statistics Service of Ukraine, Head of the 2025-26 MICS Ukraine Technical Committee
Serhiy Tityuk	Program Analyst at the United Nations Population Fund (Committee member by early 2026)
Elvira Saulyak	Program Assistant at the United Nations Population Fund (Committee member after early 2026)
Iryna Loktyeva	Specialist, National Monitoring System, International Organization for Migration
Assaf Deniz	Head of the Department of Health Information Management at the World Health Organization
Tobias Homan	Health Information Specialist, World Health Organization (Committee member by early 2026)
Hanna Tymchenko	Specialist, National Monitoring System, World Health Organization
Denis Dmitriev	Technical Specialist (Behavioral and Cultural Aspects), World Health Organization
Mykhailo Nguyen Nam	Technical Specialist (Medical Research), World Health Organization
Andriy Gorbal	Planning & Monitoring Officer, UNICEF Ukraine
Andriy Gerasimenko	Secretary of the 2025-26 Ukraine MICS Technical Committee

Ukrainian Center for Social Reforms

Ella Libanova	Director of the Institute for Demography and Life Quality Problems of the NAS of Ukraine *2025-26 Ukraine MICS Steering Committee Member*
Volodymyr Sarioglo	Head of the Department of Modeling of Socio-Economic Processes and Structures, Institute for Demography and Life Quality Problems of the NAS of Ukraine *Sampling Expert, 2025-26 Ukraine MICS Technical Committee Member*
Maryna Ogay	Senior Researcher at the Department of Department of Modeling of Socio-Economic Processes and Structures, Institute for Demography and Life Quality Problems of the NAS of Ukraine *Expert on developing survey tools*
Dmytro Shushpanov	Head of department of demographic modelling and forecasing, Institute for Demography and Life Quality Problems of the NAS of Ukraine *Survey methodologist*
Svitlana Aksyonova	Acting Head of the Department of Demographic Processes Study and Population Policy, Institute for Demography and Life Quality Problems of the NAS of Ukraine *Survey methodologist*
Borys Krimer	Leading researcher of Department of Demographic Processes Study and Population Policy, Institute for Demography and Life Quality Problems of the NAS of Ukraine *Survey methodologist*
Oleksii Pozniak	Head of Migration Studies Department, Institute for Demography and Life Quality Problems of the NAS of Ukraine *Survey methodologist*
Oleksandr Tsymbal	Head of the Department of Employment Risk Research, Institute for Demography and Life Quality Problems of the NAS of Ukraine
Lyudmyla Cherenko	Head of the Department of Quality of Life Research, Institute for Demography and Life Quality Problems of the NAS of Ukraine
Liudmyla Hryhorieva	Administrative and communication manager, Project Coordinator
Nataliia Levkovska	Fieldwork Coordinator
Lyudmila Kovalenko	Field Coordinator Assistant
Lilia Okhremko	Field Coordinator Assistant
Nataliia Shapran	Data Processing and Software Expert
Iryna Gerasymenko	Fieldwork Telephone Monitoring Expert
Volodymyr Boiko	System Administrator
Volodymyr Yurchuk	Data Processing and Software Assistant
Daria Korotkova	Sample expert and Data processing assistant
Maksym Otkydach	Sample expert and Data processing assistant
Anton Kuranda	Data processing assistant
Vira Gruznykh	Project Accountant
Vasyl Voskoboynik	Consultant on information campaign and communication
Oksana Shmorgun	Administrative and communication assistant
Valeria Chabanova	Literary editor
Vitalii Perepelytsia	Layout designer
Serhiy Vasylchenko	GIS expert
Zhanna Forosenko	GIS expert

Appendix C. Estimates of sampling errors

The sample of respondents selected in the 2025-26 Ukraine MICS is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results based on the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly but can be estimated statistically from the survey data.

The following sampling error measures are presented in this appendix for each of the selected indicators:

1. *Standard error* (*se*): Standard error is the square root of the variance of the estimate. For survey indicators that are means, proportions or ratios, the Taylor series linearization method is used for the estimation of standard errors. For more complex statistics, such as fertility and mortality rates, the Jackknife repeated replication method is used for standard error estimation.

2. *Coefficient of variation* (*se*/*r*) is the ratio of the standard error to the value (*r*) of the indicator and is a measure of the relative sampling error.

3. *Design effect* (*deff*) is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling based on the same sample size. The *square root of the design effect* (*deft*) is used to show the efficiency of the sample design in relation to the precision. A *deft* value of 1.0 indicates that the sample design of the survey is as efficient as a simple random sample for a particular indicator, while a *deft* value above 1.0 indicates an increase in the standard error due to the use of a complex sample design. If a *deft* (or *deff*) value is less than 1.0 and the corresponding number of observations is relatively small, the values of the standard error and confidence limits should be used with caution. These situations might stem from the small number of observations and the distribution of the indicator values within and between the sample clusters in such estimation domains.

4. *Confidence limits* are calculated to show the interval which contains the true value of the indicator for the population, with a specified level of confidence. For MICS results 95% confidence intervals are used, which is the standard for this type of survey. The concept of the 95% confidence interval can be understood in this way: if many repeated samples of identical size and design were taken and the confidence interval computed for each sample, then 95% of these intervals would contain the true value of the indicator.

For the calculation of sampling errors from MICS data, programs developed in SPSS Version 24, using the Complex Samples module, have been used. The Taylor linearization method has been applied for variance estimation of survey estimates such as means or proportions, while the Jackknife repeated replication method has been used for more complex statistics, including fertility and mortality rates. The results are shown in the tables that follow. Sampling errors are calculated for SDG indicators for which SEs can be calculated, and several other MICS indicators. Definitions, numerators, and denominators of each of these indicators are provided in Chapter 3. Results are presented for the national level (Table SE.1), for urban and rural areas (Tables SE.2 and SE.3), and for all macroregions (Tables SE.4 to SE.8).

In addition to the sampling error measures described above, the tables also include weighted and unweighted counts of denominators for each indicator. Given the use of normalised weights, by comparing the weighted and unweighted counts it is possible to determine whether a particular domain has been under-sampled or over-sampled compared to the average sampling rate. If the weighted count is smaller than the unweighted count, this means that the domain had been over-sampled. For the following indicators, however, the unweighted count represents the number of sample households, and the weighted counts reflect the weighted total population living in these households:

- Access to consistent sources of electricity
- Primary reliance on clean fuels and technologies for cooking, space heating and lighting
- Use of at least basic drinking water services
- Use of improved water sources on premises
- Use of improved water source with water available when needed
- Availability of drinking water in the last month
- Use of improved water source free from faecal contamination
- Use of safely managed drinking water services
- Handwashing facility with water and soap at home
- Use of basic sanitation services
- Safe disposal in situ of waste/excreta from improved on-site sanitation facilities
- Removal of waste/excreta from improved on-site sanitation facilities for treatment off-site
- Safely managed on-site sanitation

Table SE.1: Sampling errors: Total sample

Standard errors, coefficients of variation, design effects (deff), square root of design effects (deft), and confidence intervals for selected SDG and MICS indicators, Ukraine MICS, 2025-26

[A] As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those shown for individuals in Tables SR.5.1W, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights. Tables DQ.1.2W, DQ.1.3 and DQ.1.4 similarly use household sample weights and do not match distributions obtained through individual questionnaires.

Table DQ.1.2W: Age distribution of eligible and interviewed women

Household population of women age 10-54 years, interviewed women age 15-49 years, and percentage of eligible women who were interviewed, Ukraine MICS, 2025-26

	Household population of women age 10-54 years	Interviewed women age 15-49 years		Percentage of eligible women interviewed (Completion rate)

Percentage born in same month as month of interview	7.0	2.5	4.3	4.0	6.6	10.5	77.9	0.0	6.2
Number of children age 5-9	14	366	350	318	297	357	16	2	1720

[A] As the survey fieldwork took place during October-March, the values for the first and last year shown here will be truncated.

D.3 Completeness and measurements

Table DQ.3.1: Completeness and quality of information of water quality testing

Percentage of households selected for and with complete water quality testing at household and source, percentage of households selected for and with complete water quality lab testing at sourse, and (unweighted) percentage of positive blank tests, Ukraine MICS, 2025-26

	Percentage of households:		Number of households	Percentage of households with complete water quality test for:			Number of households selected for Water Quality Testing Questionnaire[B]	Blank tests (unweighted)		
	Selected for Water Quality Testing questionnaire[B]	With completed Water Quality Testing questionnaire		Household drinking water	Source of drinking water	Source of drinking water (Lab testing)		Percentage positive among completed	Number completed	Number of households selected[A]
Total	**20.3**	**13.7**	**16186**	**67.5**	**63.5**	**14.5**	**3290**	**0.0**	**451**	**652**
Area										
Urban	20.2	13.6	10411	67.4	62.4	13.6	2101	0.0	271	402
Rural	20.6	13.9	5775	67.7	65.4	16.2	1189	0.0	180	250
Degree of urbanisation										
High	20.2	13.9	5973	68.6	63.7	11.8	1206	0.0	144	221
Moderate	20.4	13.7	5634	67.4	63.5	13.3	1147	0.0	172	244
Low	20.5	13.5	4578	66.1	63.2	19.6	937	0.0	135	187

[A] One blank test (a test of uncontaminated water) was performed in each cluster. For practical reasons, the blank test was assigned to first of the households selected for water quality testing.

[B] Households selected for water quality lab testing are the same households selected for water quality testing.

Table DQ.3.2W: Completeness of information on dates of marriage/union (women)

Percentage of ever-married women age 15-49 years with missing or incomplete information on date of and age at first marriage/union, Ukraine MICS, 2025-26

	Percentage of women with:		Age at first marriage/ union DK/missing	Number of women ever married
	Date of first marriage/ union missing: Only month missing	Date of first marriage/union missing: Both month and year missing

8	139	9.7	111	7.7
9	74	5.2	55	3.8
Index of dissimilarity[A]	na	10.5	na	17.0

[A] A measure of digit preference calculated as half of the sum of the absolute differences to the expected 10%, that is, the percentage of all measurements that would need to be moved to achive the expected 10% of measurements.on each terminal digit.

na: not applicable

Table DQ.3.14: Interference in anthropometric measurements (children age 5-9 years)

Percentage (unweighted) of selected and measured children age 5-9 years for whom measurement of height/length were interfered with by braided or ornamented hair and percentage (unweighted) who wore more than very light clothing or only undergarments during weight measurement, Ukraine MICS, 2025-26

	Percentage of children who wore braided or ornamented hair that interfered with height/length measurement	Number of selected children age 5-9 years with height/length measurements	Percentage of children who wore more than very light clothing or only undergarments during weight measurement	Number of selected children age 5-9 years with weight measurements
Total	0.6	1434	9.1	1433

20+	1252	23	1275	96.4	90.1	96.3	117.2	260.3	118.8	na	na	na

[A] Both month and year of birth given. The inverse of the percent reported is the percent with incomplete and therefore imputed date of birth.

[B] (Bm/Bf) x 100, where Bm and Bf are the numbers of male and female births, respectively.

[C] (2 x Bt/(Bt-1 + Bt+1)) x 100, where Bt is the number of births in year t preceding the survey.

na: not applicable

Table DQ.6.3: Reporting of age at death in days

Distribution of deaths under age one month in reported age of death in days, and the percentage of neonatal deaths reported to occur at ages 0–6 days, by 5-year periods preceding the survey, as reported in the (imputed) birth histories of women age 15-49 years, Ukraine MICS, 2025-26

Percent neonatal[A]	**50.3**	**38.4**	**70.9**	**55.7**	**51.5**

[A] Deaths under one month, divided by deaths under one year.

[B] Includes deaths under one month reported in days.

D.8 Interview metadata

Table DQ.8.1: Interview languages

Percentage of interviews in languages of questionnaires, interviews, and native language of the respondent, use of translator, percentage of interviews with language consistency, Ukraine MICS, 2025-26

	Questionnaire			
	Household	Women 15-49	Children Under 5	Children and adolescents 5-17
Percentage of interviews with language consistency[A]	83.5	86.8	89.0	85.4
Language of the questionnaire				
Ukrainian	100.0	100.0	100.0	100.0
Other language	0.0	0.0	0.0	0.0
Language of the interview				
Ukrainian	99.6	99.6	98.9	99.4
Other language	0.4	0.4	1.1	0.6
Native language of the respondent				
Ukrainian	84.1	88.2	90.3	87.5
Russian	14.8	10.7	8.1	10.6
Other language	1.1	1.1	1.6	1.9
Use of translator				
Entire questionnaire	0.8	1.7	1.9	2.4
Part of questionnaire	0.1	0.2	0.1	0.4
Not used	99.1	98.1	98.0	97.1
Number of completed interviews	**16186**	**7033**	**3067**	**5022**

[A] A language consistent interview is with matching language of interview, questionnaire, and native language of respondent, as well with no use of translator.

Table DQ.8.2: Interview privacy

Percentage of women 15-49 questionnaire conducted in privacy, Ukraine MICS, 2025-26

Privacy during entire individual interview	
Entirely in private	99.1
Part in private	0.6
Not in private	0.3
Number of completed interviews	**7033**

Table DQ.8.3: Interview durations

Measures of interview duration by questionnaire (excluding time spent between interviews and on measurements), Ukraine MICS, 2025-26

	Questionnaire				Total for all interviews in household
	Household	Women 15-49	Children Under 5	Children and adolescents 5-17	
Average number of questionnaires completed per household	1.0	0.4	0.2	0.2	1.8
Average duration of interview (in minutes)	23	16	8	6	31
Median duration of interview (in minutes)	11	11	6	4	17
Percentage of questionnaires excluded from duration analysis					
Inconsistent information[A]	8.5	0.8	0.5	0.5	4.9
Out of range[B]	7.2	0.8	0.5	0.4	4.2
Missing	0.0	0.0	0.0	0.0	0.0
Total number of completed questionnaires	**16186**	**7033**	**3067**	**3626**	**29912**

[A] Inconsistent is defined as interviews with end time before start time.

[B] Out of range is defined as interviews longer than 3 hours.

D.9 Consent for follow-up

Table DQ.9.1: Telephone availability and consent for potential follow-up survey

Percent distribution of households by availability of telephone and consent for follow-up survey and percentage of households with at least one respondent consenting for follow-up survey and providing a phone number, Ukraine MICS, 2025-26

	Percent distribution of households with members reporting:					Total	Percentage of households with at least one respondent:		Number of households
	Telephone in household		No telephone in household						
			Consent for follow-up						
	Consent for follow-up	No consent for follow-up	Confirming no phone number	Providing a phone number	No consent for follow-up		consenting for follow-up	consenting for follow-up and providing a phone number

ПАНЕЛЬ ІНФОРМАЦІЇ ПРО ДОМОГОСПОДАРСТВО		**НН**
НН1. *Номер кластера:* ___ ___ ___ ___	**НН2**. *Номер домогосподарства:* ___ ___	
НН3. *Ім'я та номер інтерв'юєра:* ІМ'Я_____ ___ ___ ___	**НН4**. *Ім'я та номер координатора:* ІМ'Я _____ ___ ___ ___	
НН5. *День/місяць/рік проведення опитування:* ___ ___/___ ___/ 2 0 2 ___	**НН6**. *Тип місцевості:*	МІСЬКА.....1 СІЛЬСЬКА ..2
НН7. *Назва та номер області:* НАЗВА _____ ___ ___	**НН7А**. *Назва та номер району:* НАЗВА _____ ___ ___	
НН9. *Чи відібрано домогосподарство для заповнення Бланка для тестування якості води?*	ТАК.....1 НІ.....2	
НН10. *Чи відібрано домогосподарство для холостого тестування?*	ТАК.....1 НІ.....2	

Перед початком опитування, переконайтеся, що респондент/респондентка є обізнаним повнолітнім членом домогосподарства. Якщо в домогосподарстві немає жодного дорослого або всі дорослі члени домогосподарства недієздатні, ви можете опитати дитину віком 15–17 років. Дитину віком молодше 15 років не можна опитувати.	**НН11**. *Запишіть час.* ГОДИНА : ХВИЛИНИ __ __ : __ __

НН12. Доброго дня, мене звати (***ваше ім'я***). Ми з «Українського центру соціальних реформ». Спільно з Державною службою статистики України ми проводимо дослідження щодо становища дітей, сімей та домогосподарств.

Це інтерв'ю зазвичай триває близько 40 хвилин.

Участь у дослідженні є добровільною. За неї Ви та члени Вашої родини не зможете отримати жодної винагороди чи заохочення. Однак зібрана інформація матиме суспільну користь і посприяє кращому розумінню становища та потреб населення.

Будьте певні, що вся інформація, якою Ви поділитеся під час інтерв'ю, залишиться суворо конфіденційною та анонімною. Жодна інформація про Вас та Ваше домогосподарство не буде оприлюднена. Результати дослідження будуть доступними виключно в узагальненому для населення вигляді.

Якщо Вам дискомфортно через певне запитання і Ви не хочете відповідати, просто скажіть мені й ми його пропустимо. Також якщо Ви захочете зупинити інтерв'ю в будь-який момент, просто скажіть мені.

Якщо у Вас виникнуть будь-які скарги чи занепокоєння щодо цього дослідження, будь ласка, зверніться за телефоном гарячої лінії, наведеної у цьому буклеті.

Чи можу я розпочати інтерв'ю?

ТАК.....1 НІ / НЕ ЗАПИТАЛИ 2	1 ⇨ *ПЕРЕЛІК ЧЛЕНІВ ДОМОГОСПОДАРСТВА* 2 ⇨ *НН46*

ПЕРЕЛІК ЧЛЕНІВ ДОМОГОСПОДАРСТВА — HL

Спочатку заповніть HL2–HL4 по вертикалі для всіх членів домогосподарства, починаючи з голови домогосподарства. Після цього обов'язково уточніть, чи немає ще інших членів домогосподарства: тих, кого зараз немає вдома; немовлят або маленьких дітей; інших осіб, які не є членами сім'ї (наприклад, прислуга, друзі), але зазвичай мешкають у домогосподарстві. Потім поставте запитання HL5–HL20 для кожного члена домогосподарства по черзі. Якщо будуть використовуватися додаткові анкети, вкажіть про це, поставивши позначку в цьому полі: □

HL1. *Номер рядка*	**HL2.** Передусім назвіть, будь ласка, імена всіх осіб, які зазвичай тут мешкають, починаючи з голови домогосподарства. *З'ясуйте, чи мешкають у домогосподарстві будь-які інші особи.*	**HL3.** Яка спорідненість між (***ім'я***) та (***ім'я голови домогосподарства***)?	**HL4.** (Ім'я) чоловічої чи жіночої статі? 1. ЧОЛОВІК 2. ЖІНКА	**HL5.** Яка дата народження (***ім'я***)? 98 НЗ 9998 НЗ	**HL6.** Скільки років (***ім'я***)? *Укажіть вік у вигляді кількості повних років. Якщо вік становить 95 чи більше років, укажіть «95».*	**HL8.** *Обведіть номер рядка, якщо жінці 15–49 років*	**HL10.** *Обведіть номер рядка, якщо дитині 0–4 роки*	**HL11.** *Вік 0–17 років?* 1. ТАК 2. НІ ⇨ *наступний рядок*	**HL12.** Чи жива біологічна мати (***ім'я***)? 1. ТАК 2. НІ ⇨ *HL16* 8. НЗ ⇨ *HL16*	**HL13.** Чи мешкає біологічна мати (***ім'я***) у цьому домогосподарстві? 1. ТАК 2. НІ ⇨ *HL15*	**HL14.** *Впишіть номер рядка матері та перейдіть до HL16.*	**HL15.** Де мешкає біологічна мати (***ім'я***)? 1. ЗА КОРДОНОМ 2. В ІНШОМУ ДОМОГОСПОДАРСТВІ В ТІЙ САМІЙ ОБЛАСТІ 3. В ІНШОМУ ДОМОГОСПОДАРСТВІ В ІНШІЙ ОБЛАСТІ 4. ЗАКЛАД/УСТАНОВА В УКРАЇНІ 8. НЕ ЗНАЮ	**HL16.** Чи живий біологічний батько (***ім'я***)? 1. ТАК 2. НІ ⇨ *HL20* 8. НЗ ⇨ *HL20*	**HL17.** Чи мешкає біологічний батько (***ім'я***) у цьому домогосподарстві? 1. ТАК 2. НІ ⇨ *HL19*	**HL18.** *Впишіть номер рядка батька та перейдіть до HL20.*	**HL19.** Де мешкає біологічний батько (***ім'я***)? 1. ЗА КОРДОНОМ 2. В ІНШОМУ ДОМОГОСПОДАРСТВІ В ТІЙ САМІЙ ОБЛАСТІ 3. В ІНШОМУ ДОМОГОСПОДАРСТВІ В ІНШІЙ ОБЛАСТІ 4. ЗАКЛАД/УСТАНОВА В УКРАЇНІ 8. НЕ ЗНАЮ	*HL20. Впишіть номер рядка матері з HL14. Якщо графа порожня, запитайте:* Хто є основним піклувальником (***ім'я***)? *Якщо «Ніхто» для дитини віком 15–17 років, запишіть «90».*

СТАН ПІД ЧАС НАДЗВИЧАЙНОЇ СИТУАЦІЇ		**PE**
PE1. Ми хочемо поговорити з Вами про період від початку повномасштабного вторгнення російської федерації в Україну 24 лютого 2022 року до сьогодні. Далі в анкеті цей період я називатиму - повномасштабне вторгнення. Чи є хтось, хто не був членом цього домогосподарства до початку повномасштабного вторгнення та переїхав жити до цього домогосподарства через повномасштабне вторгнення?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ 8	2 ⇨*PE3* 8 ⇨*PE3*
PE2. Скільки осіб переїхало жити до цього домогосподарства?	КІЛЬКІСТЬ ОСІБ.....__ __	
PE3. Чи переїжджали всі члени цього домогосподарства в інше місце через повномасштабне вторгнення в будь-який час від її початку? *Якщо «Ні», з'ясуйте, чи всі члени домогосподарства залишалися на одну ніч або більше в іншому місці. Якщо так, запишіть 1 для відповіді «Так».*	ТАК ..... 1 НІ 2	2 ⇨*PE5*
PE4. Як довго всі члени цього домогосподарства проживали в іншому місці (інших місцях)? *Якщо хтось із членів домогосподарства все ще проживає в іншому місці, запишіть 995. Якщо менше тижня, запишіть кількість днів.*	ДНІВ.....1 ____ ____ ТИЖНІВ.....2 ____ ____ МІСЯЦІВ .....3 ____ ____ ЩЕ НЕ ПОВЕРНУЛИСЯ .....995 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 998	

PE5. Через повномасштабне вторгнення чи було пошкоджено або зруйновано Ваш будинок?	ТАК ..... 1 НІ 2	
PE6. Серед осіб, які проживали в домогосподарстві під час повномасштабного вторгнення, чи загинув хтось безпосередньо внаслідок повномасштабного вторгнення?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	
PE7. Під час повномасштабного вторгнення чи потребував хтось з членів цього домогосподарства медичної допомоги з будь-якої причини?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	2 ⇨*PE9* 8 ⇨*PE9*
PE8. Чи всі члени домогосподарства, які потребували медичної допомоги, отримали її?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	
PE9. Тепер я хочу запитати вас про серйозні захворювання, спричинені повномасштабним вторгненням. Це може бути, для прикладу, психічні, серцево-судинні захворювання, контузія тощо. Чи хтось із членів цього домогосподарства серйозно захворів під час повномасштабного вторгнення?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	2 ⇨*PE11* 8 ⇨*PE11*
PE10. У результаті хвороби/хвороб чи була ця особа (чи були ці особи) не в змозі виконувати звичайну повсякденну діяльність, наприклад ходити на роботу або до школи, протягом більше ніж 3 місяців поспіль?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	
PE11. Чи хтось із членів цього домогосподарства отримав серйозні поранення та травми через повномасштабне вторгнення?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	
PE12. Чи хтось із членів Вашого домогосподарства був відокремленим від домогосподарства через повномасштабне вторгнення, навіть якщо це було тимчасово? *Якщо «Ні», з'ясуйте*, чи хтось із членів домогосподарства переїхав жити до родичів або сусідів, або був затриманий, або зник, навіть якщо це було тимчасово? *Якщо будь-що з цього відбулося, запишіть «Так».* *Зверніть увагу, що члени домогосподарства, які є мобілізованими, не вважаються відокремленими.*	ТАК ..... 1 НІ 2	2 ⇨*PE15*
PE13. Скільки членів домогосподарства були відокремленими?	КІЛЬКІСТЬ ОСІБ ..... __ __	
PE14. Чи було комусь із відокремлених членів домогосподарства менше 18 років на момент відокремлення?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	

PE15. Чи проживали в цьому домогосподарстві діти віком 5–17 років у будь-який час від початку повномасштабного вторгнення до сьогодні?	ТАК ..... 1 НІ 2	2 ⇨*PE18*
PE16. Чи відвідував хтось із цих дітей заклад освіти до повномасштабного вторгнення?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ 8	2 ⇨*PE18* 8 ⇨*PE18*
PE17. Від початку повномасштабного вторгнення чи хтось із цих дітей віком 5–17 років припинив відвідувати заклад освіти через повномасштабне вторгнення, навіть якщо це було тимчасово?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8	
PE18. Від початку повномасштабного вторгнення чи було основне джерело питної води домогосподарства непридатним для використання через повномасштабне вторгнення, навіть якщо це було тимчасово?	ТАК ..... 1 НІ ..... 2 НЕ ЗНАЮ / НЕ ВПЕВНЕНИЙ 8

HH44C. Дякуємо за участь в опитуванні. УЦСР проводитиме опитування про становище дітей, сімей та домогосподарств у майбутньому. Це будуть короткі інтерв'ю тривалістю приблизно 15 хвилин. Протягом декількох місяців ми можемо зв'язатися з Вами декілька разів. Участь в опитуванні є добровільною. Якщо Ви погодитеся на участь зараз, Ви можете пізніше відмовитися від неї. Участь у дослідженні є безкоштовною. Вся інформація, якою Ви поділитеся під час інтерв'ю, не буде передана нікому за межами нашої команди. Бажаєте взяти участь?	ТАК ..... 1 НІ 2	2 ⇨ *HH46*
HH44D. Ви сказали, що у Вашому домогосподарстві немає телефону. Скажіть, будь ласка, чи маєте Ви особистий номер телефону або номер телефону домогосподарства?	ТАК ..... 1 НІ 2	1 ⇨ *HH44F* 2 ⇨ *HH46*
HH44E. Чи маєте Ви особистий номер телефону або номер телефону домогосподарства?	ТАК ..... 1 НІ 2	2 ⇨ *HH46*

H44F. Ви можете поділитися номером телефону Вашого домогосподарства, але, будь ласка, не називайте особистих номерів телефонів, які належать іншим членам Вашого домогосподарства або особам, які не є членами Вашого домогосподарства. Будь ласка, скажіть мені, за яким номером телефону ми зможемо Вам подзвонити.

Перевірте вік жінки в HL6 у ПЕРЕЛІКУ ЧЛЕНІВ ДОМОГОСПОДАРСТВА в АНКЕТІ ДОМОГОСПОДАРСТВА. Якщо вік жінки 15–17 років, переконайтеся, що згода дорослих на проведення інтерв'ю отримана (HH33) або в ній немає необхідності (HL20 = 90). Якщо згода необхідна, але не отримана, не розпочинайте опитування, а в WM17 запишіть «06».	**WM7**. *Запишіть час:* ГОДИНА : ХВИЛИНИ __ __ : __ __

WM8. *Перевірте заповнені анкети в цьому домогосподарстві. Чи ви або інший член вашої команди вже опитували цю респондентку для заповнення іншої анкети?*	ТАК, ВЖЕ ОПИТУВАЛИ .....1 НІ, ОПИТУЄТЬСЯ ВПЕРШЕ.....2	1 ⇨*WM9B* 2 ⇨*WM9A*

WM9A. Доброго дня, мене звати (***ваше ім'я***). Ми з Українського центру соціальних реформ. Спільно з Державною службою статистики України ми проводимо дослідження щодо становища дітей, сімей та домогосподарств. Я хотів би поговорити з Вами про Ваше здоров'я та на інші теми. Ми також опитуємо матерів про їхніх дітей. Це інтерв'ю зазвичай триває близько 25 хвилин. Участь у дослідженні є добровільною. За нього Ви не зможете отримати жодної винагороди чи заохочення. Однак зібрана інформація буде мати суспільну користь та посприяє кращому розумінню становища та потреб жінок. Будьте певні, що вся інформація, якою Ви поділитеся під час інтерв'ю, залишиться суворо конфіденційною та анонімною. Жодна інформація про Вас не буде оприлюднена. Результати дослідження будуть доступними виключно в узагальненому для населення вигляді. Якщо Вам дискомфортно через певне запитання і Ви не хочете відповідати, просто скажіть мені й ми його пропустимо. Також якщо Ви захочете зупинити інтерв'ю в будь-який момент, просто скажіть мені. Якщо у Вас виникнуть будь-які скарги чи занепокоєння щодо цього дослідження, будь ласка, зверніться за телефоном гарячої лінії, наведеної у цьому буклеті. Чи можу я розпочати інтерв'ю?	**WM9B**. Тепер я хочу поговорити з Вами детальніше про Ваше здоров'я та на інші теми. Це інтерв'ю зазвичай триває близько 25 хвилин. Участь у цьому дослідженні є добровільною. За неї Ви не зможете отримати жодної винагороди чи заохочення. Однак зібрана інформація буде мати суспільну користь та посприяє кращому розумінню становища та потреб жінок. Будьте певні, що вся інформація, якою Ви поділитеся під час інтерв'ю, залишиться суворо конфіденційною та анонімною. Жодна інформація про Вас або Вашу дитину не буде оприлюднена. Результати дослідження будуть доступними виключно в узагальненому для населення вигляді. Якщо Ви не хочете відповідати на певне запитання або хочете зупинити інтерв'ю в будь-який момент, будь ласка, просто скажіть мені про це. Якщо у Вас виникнуть будь-які скарги чи занепокоєння щодо цього дослідження, будь ласка, зверніться за телефоном гарячої лінії, наведеної у буклеті, який я Вам раніше дала. Чи можу я розпочати інтерв'ю?

ДИСКРИМІНАЦІЯ **VT**

VT23. Тепер я запитаю Вас про дискримінацію. Дискримінація – це коли до Вас ставляться менш прихильно, ніж до інших, або переслідують через те, як Ви виглядаєте, якого Ви походження, які маєте переконання або з інших причин.

Протягом останніх 3 років, тобто від (***рік проведення інтерв'ю мінус 3),*** чи вважаєте Ви, що особисто зазнали будь-якої форми дискримінації або переслідувань за будь-якою з наведених нижче ознак саме в Україні? *Запитання стосуються останніх 3 років. Якщо відповідь «Так», поставте додаткове запитання, щодо останнього року, а програма CAPI додасть речення на початку наступного пункту, щоб нагадати респондентці повернутися до трирічного періоду.*		ТАК	НІ	НЕ ЗНАЮ
[A] Ваша стать, наприклад дехто може зазнавати дискримінацію через те, що він – чоловік, або що вона – жінка?	СТАТЬ	1	2 ⇩ *VT23[B]*	8 ⇩ *VT23[B]*

UF10A. Доброго дня, мене звати (ваше ім'я). Ми з Українського центру соціальних реформ. Спільно з Державною службою статистики України ми проводимо дослідження щодо становища дітей, сімей та домогосподарств. Я хотів би поговорити з Вами про здоров'я та благополуччя (***ім'я дитини з UF3***). Це інтерв'ю зазвичай триває близько 20 хвилин. Участь в дослідженні є добровільною. За неї Ви не зможете отримати жодної винагороди чи заохочення. Однак зібрана інформація матиме суспільну користь і посприяє кращому розумінню становища та потреб дітей молодшого віку. Будьте певні, що вся інформація, якою Ви поділитеся під час інтерв'ю, залишиться суворо конфіденційною та анонімною. Жодна інформація про Вас або Вашу дитину не буде оприлюднена. Результати дослідження будуть доступними виключно в узагальненому для населення вигляді. Якщо Вам дискомфортно через певне запитання і Ви не хочете відповідати, просто скажіть мені й ми його пропустимо. Також якщо Ви захочете зупинити інтерв'ю в будь-який момент, просто скажіть мені. Якщо у Вас виникнуть будь-які скарги чи занепокоєння щодо цього дослідження, будь ласка, зверніться за телефоном гарячої лінії, наведеної у цьому буклеті. Чи можу я розпочати інтерв'ю?	**UF10B**. Тепер я хочу поговорити з Вами детальніше про здоров'я та благополуччя (***ім'я дитини з FS3***). Це інтерв'ю зазвичай триває близько 20 хвилин. Участь у цьому дослідженні є добровільною. За неї Ви не зможете отримати жодної винагороди чи заохочення. Однак зібрана інформація матиме суспільну користь і посприяє кращому розумінню становища та потреб дітей молодшого віку. Будьте певні, що вся інформація, якою Ви поділитеся під час інтерв'ю, залишиться суворо конфіденційною та анонімною. Жодна інформація про Вас або Вашу дитину не буде оприлюднена. Результати дослідження будуть доступними виключно в узагальненому для населення вигляді. Якщо Ви не хочете відповідати на певне запитання або хочете зупинити інтерв'ю в будь-який момент, будь ласка, просто скажіть мені про це. Якщо у Вас виникнуть будь-які скарги чи занепокоєння щодо цього дослідження, будь ласка, зверніться за телефоном гарячої лінії, наведеної у буклеті, який я Вам раніше дала. Чи можу я розпочати інтерв'ю?

Перевірте вік респондента в HL6 у ПЕРЕЛІКУ ЧЛЕНІВ ДОМОГОСПОДАРСТВА в АНКЕТІ ДОМОГОСПОДАРСТВА. Якщо вік респондента 15–17 років, то переконайтеся, що згода дорослих на проведення інтерв'ю отримана (HH33 або HH39/HH39A) або в ній немає необхідності (HL20 = 90). Якщо згода необхідна, але не отримана, не розпочинайте опитування, а в UF17 запишіть «06». Респондентові має бути щонайменше 15 років. У дуже рідкісних випадках, коли дитина віком 15–17 років не має матері або опікуна в домогосподарстві (HL20 = 90), респондентом буде сама дитина.

FS10A. Доброго дня, мене звати (***ваше ім'я***). Ми з «Українського центру соціальних реформ». Спільно з Державною службою статистики України ми проводимо дослідження щодо становища дітей, сімей та домогосподарств. Я хотів би поговорити з вами про здоров'я та благополуччя (***ім'я дитини з FS3***). Це інтерв'ю зазвичай триває близько 15 хвилин. Участь у дослідженні є добровільною. За нього Ви не зможете отримати жодної винагороди чи заохочення. Однак зібрана інформація буде мати суспільну користь та посприяє кращому розумінню становища та потреб дітей та підлітків. Будьте певні, що вся інформація, якою Ви поділитеся під час інтерв'ю, залишиться суворо конфіденційною та анонімною. Жодна інформація про Вас або Вашу дитину не буде оприлюднена. Результати дослідження будуть доступними виключно в узагальненому для населення вигляді. Якщо Вам дискомфортно через певне запитання і Ви не хочете відповідати, просто скажіть мені й ми його пропустимо. Також якщо Ви захочете зупинити інтерв'ю в будь-який момент, просто скажіть мені. Якщо у Вас виникнуть будь-які скарги чи занепокоєння щодо цього дослідження, будь ласка, зверніться за телефоном гарячої лінії, наведеної у цьому буклеті. Чи можу я розпочати інтерв'ю?	**FS10B.** Тепер я хочу поговорити з Вами детальніше про здоров'я та благополуччя (***ім'я дитини з FS3***). Це інтерв'ю зазвичай триває близько 15 хвилин. Участь в цьому дослідженні є добровільною. За неї Ви не зможете отримати жодної винагороди чи заохочення. Однак зібрана інформація буде мати суспільну користь та посприяє кращому розумінню становища та потреб дітей та підлітків. Будьте певні, що вся інформація, якою Ви поділитеся під час інтерв'ю, залишиться суворо конфіденційною та анонімною. Жодна інформація про Вас або Вашу дитину не буде оприлюднена. Результати дослідження будуть доступними виключно в узагальненому для населення вигляді. Якщо Ви не хочете відповідати на певне запитання або хочете зупинити інтерв'ю в будь-який момент, будь ласка, просто скажіть мені про це. Якщо у Вас виникнуть будь-які скарги чи занепокоєння щодо цього дослідження, будь ласка, зверніться за телефоном гарячої лінії, наведеної у буклеті, який я Вам раніше дала. Чи можу я розпочати інтерв'ю?

FCD2. Тепер я хочу поговорити з Вами про дещо інше. Дорослі використовують певні способи, щоб навчити дітей правильній поведінці або вирішити проблеми з поведінкою. Я зачитаю різні методи, які використовуються. Скажіть, будь ласка, протягом останнього місяця чи використовували Ви або хтось інший із дорослих членів Вашого домогосподарства цей метод щодо (***ім'я***). [A] Забирали привілеї, забороняли те, що подобається (***ім'я***), або не дозволяли (***йому/їй***) виходити з дому. [B] Пояснювали, чому поведінка (***ім'я***) була неправильною. [C] Трясли (***його/її***). [D] Нагримали, накричали або зірвалися на (***нього/неї***). [E] Дали (***йому/їй***) щось інше, чим можна зайнятися. [F] Шльопнули, вдарили або ляснули (***його/її***) по сідницях безпосередньо рукою. [G] Вдарили (***його/її***) по сідницях або інших частинах тіла чимось на кшталт ременя, гребінця, палиці чи іншого твердого предмета. [H] Називали (***його/її***) тупим/тупою, ледачим/ледачою або іншими подібними словами. [I] Вдарили або ляснули (***його/її***) по обличчю, голові або вухах. [J] Вдарили або ляснули (***його/її***) по кистях рук, руці або нозі. [K] Побили (***його/її***), тобто завдавали ударів знову і знову так сильно, як тільки можна.	ТАК НІ ЗАБИРАЛИ ПРИВІЛЕЇ .....1 2 ПОЯСНЮВАЛИ НЕПРАВИЛЬНУ ПОВЕДІНКУ .....1 2 ТРЯСЛИ ЙОГО/ЇЇ .....1 2 НАГРИМАЛИ / НАКРИЧАЛИ / ЗІРВАЛИСЯ .....1 2 ДАЛИ ЩОСЬ ІНШЕ, ЧИМ МОЖНА ЗАЙНЯТИСЯ .....1 2 ШЛЬОПНУЛИ, ВДАРИЛИ АБО ЛЯСНУЛИ ПО СІДНИЦЯХ РУКОЮ .....1 2 ВДАРИЛИ РЕМЕНЕМ, ГРЕБІНЦЕМ, ПАЛИЦЕЮ АБО ІНШИМ ТВЕРДИМ ПРЕДМЕТОМ.....1 2 НАЗИВАЛИ ТУПИМИ, ЛЕДАЧИМИ АБО ІНШИМИ ПОДІБНИМИ СЛОВАМИ..1 2 ВДАРИЛИ/ЛЯСНУЛИ ПО ОБЛИЧЧЮ, ГОЛОВІ АБО ВУХАХ.....1 2 ВДАРИЛИ / ЛЯСНУЛИ ПО КИСТЯХ РУК, РУЦІ АБО НОЗІ .....1 2 ПОБИЛИ, ЗАВДАЮЧИ УДАРІВ ТАК СИЛЬНО, ЯК ТІЛЬКИ МОЖНА 1 2

Check that the respondent is a knowledgeable member of the household and at least 18 years old before proceeding. You may only interview a child age 15-17 if there is no adult member of the household or all adult members are incapacitated. You may not interview a child under age 15.	**HH11**. *Record the time.* HOURS : MINUTES ___ : ___

HH12. Hello, my name is (***your name***). We are from the Ukrainian Center for Social Reforms. Together with the State Statistics Service of Ukraine we are conducting a survey about the situation of children, families, and households.

This interview usually takes about 40 minutes.

Participation in this survey is voluntary. No payment or incentive will be given to you or your family members for answering these questions. However, the information gathered will be very helpful for the government and the general public to better understand the situation and needs of the population.

Please know that all the information you share during the interview will remain strictly confidential and anonymous. No information about you or your household will be made publicly available. We will only produce information about the general population.

Should you feel uncomfortable about any questions and not wish to answer, just let me know and we can skip the question. Also, if you wish to stop the interview at any point just let me know.

If at any time you have any complaints or concerns about this survey, please contact the hotline number provided in this leaflet.

May I start the interview?

YES ..... 1 NO / NOT ASKED 2	1 ⇨*LIST OF HOUSEHOLD MEMBERS* 2 ⇨*HH46*

LIST OF HOUSEHOLD MEMBERS — HL

First complete HL2-HL4 vertically for all household members, starting with the head of the household. Once HL2-HL4 are complete for all members, make sure to probe for additional members: Those that are not currently at home, any infants or small children and any others who may not be family (such as servants, friends) but who usually live in the household. Then, ask questions HL5-HL20 for each member one at a time. If additional questionnaires are used, indicate by ticking this box: ☐

HL1. *Line number*	**HL2.** First, please tell me the name of each person who usually lives here, starting with the head of the household. *Probe for additional household members.*	**HL3.** What is the relationship of (***name***) to (***name of the head of household***)?	**HL4.** Is (***name***) male or female? 1 MALE 2 FEMALE	**HL5.** What is (***name***)'s date of birth? 98 DK 9998 DK		**HL6.** How old is (***name***)? *Record in completed years. If age is 95 or above, record '95'.*	**HL8.** *Record line number if woman and age 15-49.*		**HL10.** *Record line number if age 0-4.*	**HL11.** *Age 0-17?* 1 YES 2 NO ⇨ *Next Line*	**HL12.** Is (***name***)'s natural mother alive? 1 YES 2 NO ⇨ *HL16* 8 DK ⇨ *HL16*	**HL13.** Does (***name***)'s natural mother live in this household? 1 YES 2 NO ⇨ *HL15*	**HL14.** *Record the line number of mother and go to HL16.*	**HL15.** Where does (***name***)'s natural mother live? 1 ABROAD 2 IN ANOTHER HOUSEHOLD IN THE SAME REGION 3 IN ANOTHER HOUSEHOLD IN ANOTHER REGION 4 INSTITUTION IN THIS COUNTRY 8 DK	**HL16.** Is (***name***)'s natural father alive? 1 YES 2 NO ⇨ *HL20* 8 DK ⇨ *HL20*	**HL17.** Does (***name***)'s natural father live in this household? 1 YES 2 NO ⇨ *HL19*	**HL18.** *Record the line number of father and go to HL20.*	**HL19.** Where does (***name***)'s natural father live? 1 ABROAD 2 IN ANOTHER HOUSEHOLD IN THE SAME REGION 3 IN ANOTHER HOUSEHOLD IN ANOTHER REGION 4 INSTITUTION IN THIS COUNTRY 8 DK	**HL20.** *Copy the line number of mother from HL14. If blank, ask:* Who is the primary caregiver of (***name***)? *If 'No one' for a child age 15-17, record '90'.*

POST-EMERGENCY		PE
PE1. We want to talk to you about the period from the beginning of the full-scale invasion of Ukraine by the Russian Federation on 24 February 2022 to the present day. I will refer to this period in the questionnaire as "the full-scale invasion". Did anyone who was not a member of this household before the full-scale invasion come to live in this household because of the full-scale invasion?	YES ..... 1 NO ..... 2 DON'T KNOW 8	 2 ⇨*PE3* 8 ⇨*PE3*
PE2. How many persons came to live in this household?	 NUMBER OF PERSONS ..... __ __	
PE3. At any time during the full-scale invasion, did <u>all members of this household</u> move somewhere else because of the full-scale invasion? *If 'No', probe if all the members of the household stayed one night or more in another location. If so, record 1 for 'Yes'.*	YES ..... 1 NO 2	 2 ⇨*PE5*
PE4. How long did all the members of this household live in that other place(s)? *If any household member is still at another location, record 995.* *If less than one week, record days.*	DAYS ..... **1** __ __ WEEKS ..... **2** __ __ MONTHS ..... **3** __ __ NOT YET RETURNED ..... 995 DON'T KNOW / NOT SURE 998	
PE5. Due to the full-scale invasion, was your house damaged or destroyed?	YES ..... 1 NO 2	
PE6. Did anyone who was living in the household during the full-scale invasion die as a direct result of the full-scale invasion?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	
PE7. Did any of the members of this household need medical care for any reason at the time of the full-scale invasion?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	 2 ⇨*PE9* 8 ⇨*PE9*
PE8. Did all members that needed medical care receive this care?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	
PE9. Now I would like to ask you about serious illnesses caused by the full-scale invasion. These can include, for example, mental illness, cardiovascular disease, contusion, etc. Did any member of this household become seriously ill at the time of the full-scale invasion?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	 2 ⇨*PE11* 8 ⇨*PE11*
PE10. As a result of the illness(es), (***was this person/were these persons***) unable to perform usual daily activities, such as going to work or school for more than 3 months at a time?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	
PE11. Did anyone in this household become seriously injured or suffer physical trauma due to the full-scale invasion?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	

PE12. Due to the full-scale invasion, were any household members separated from the household, even if it was temporary? *If 'No', probe:* Did any household member move to live with relatives or neighbours, or were detained or got lost, even if temporarily? *If any, record 1 for 'Yes'.* *Please note that household members who are mobilized are not considered separated.*	YES ..... 1 NO 2	2 ⇨*PE15*
PE13. How many members were separated?	NUMBER OF SEPERATED ..... __ __	
PE14. Were any of the separated members less than 18 years old at the time of separation?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	
PE15. Were there any children age 5-17 years living in this household at any time from the start of the full-scale invasion to now?	YES ..... 1 NO 2	2 ⇨*PE18*
PE16. Before the full-scale invasion, were any of these children attending school?	YES ..... 1 NO ..... 2 DON'T KNOW 8	2 ⇨*PE18* 8 ⇨*PE18*
PE17. During the full-scale invasion, did any of these children age 5 to 17 years stop attending school due to the full-scale invasion, even if temporarily?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	
PE18. During the full-scale invasion, was the household's main source of drinking water unusable because of the full-scale invasion, even if temporarily?	YES ..... 1 NO ..... 2 DON'T KNOW / NOT SURE 8	
PE19. During the full-scale invasion, was the household's main toilet facility unusable due to the full-scale invasion, even if temporarily?	YES ..... 1 NO ..... 2 NO TOILET FACILITY ..... 7 DON'T KNOW / NOT SURE 8	
PE20. Was household income affected by the full-scale invasion? *If 'Yes', probe to find whether the income increased or decreased.*	YES, INCREASED ..... 1 YES, DECREASED ..... 2 NO, NO CHANGE ..... 3 DON'T KNOW / NOT SURE 8	1 ⇨*PE22* 3 ⇨*PE22* 8 ⇨*PE22*
PE21. Why did your household's income decrease? *Probe: Anything else?* *Record all that apply.*	LOST JOB ..... A REDUCTION IN WORK HOURS / EARNINGS ..... B UNABLE TO HARVEST OR PLANT ..... C UNABLE TO MAINTAIN LIVESTOCK ..... D COULD NOT GO TO WORK ..... E COULD NOT OPEN BUSINESS ..... F LOSS OF BUSINESS LOCATION ..... G LOSS OF BUSINESS INVENTORY ..... H LOSS OF BUSINESS EQUIPMENT/ASSETS ..... I DEATH/INJURY / INJURY OF FAMILY MEMBER ..... J OTHER (*specify*) _____ X	
PE22. During the full-scale invasion, were any items of value in the home or business, either damaged, destroyed, or stolen?	YES ..... 1 NO ..... 2 DON'T KNOW 8	

WATER		WS
WS1. WOMAN'S INFORMATION PANEL	**WM**
WM1. *Cluster number:* ___ ___ ___ ___	**WM2**. *Household number:* ___ ___
WM3. *Woman's name and line number:* NAME _____ ___ ___	**WM4**. *Supervisor's name and number:* NAME _____ ___ ___ ___
WM5. *Interviewer's name and number:* NAME _____ ___ ___ ___	**WM6**. *Day / Month / Year of interview:* ___ ___ / ___ ___ / 2 0 2 ___

Check woman's age in HL6 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: If age 15-17, verify in HH33 that adult consent for interview is obtained or not necessary (HL20=90). If consent is needed and not obtained, the interview must not commence and '06' should be recorded in WM17.	**WM7**. *Record the time:* HOURS : MINUTES ___ ___ : ___ ___

WM8. *Check completed questionnaires in this household: Have you or another member of your team interviewed this respondent for another questionnaire?*	YES, INTERVIEWED ALREADY .....1 NO, FIRST INTERVIEW 2	1 ⇨*WM9B* 2 ⇨*WM9A*

WM9A. Hello, my name is (***your name***). We are from the Ukrainian Center for Social Reforms. Together with the State Statistics Service of Ukraine we are conducting a survey about the situation of children, families, and households. I would like to talk to you about your health and other topics. We are also interviewing mothers about their children. This interview usually takes about 25 minutes. Participation in this survey is voluntary. No payment or incentive will be given to you for answering these questions. However, this survey will help the government and the general public better understand the situation and needs of women. Please know that all the information you share during the interview will remain strictly confidential and anonymous. No information about you will be made publicly available. We will only produce information about the general population. Should you feel uncomfortable about any questions and not wish to answer, just let me know and we can skip the question. Also, if you wish to stop the interview at any point just let me know. If at any time you have any complaints or concerns about this survey, please contact the hotline number provided in this leaflet. May I start the interview?	**WM9B**. Now I would like to talk to you about your health and other topics in more detail. This interview will take about 25 minutes. Again, participation in this survey is voluntary. No payment of incentive will be given to you for answering these questions. However, this survey will help the government and the general public better understand the situation and needs of women. Please know that all the information you share during the interview will remain strictly confidential and anonymous. No information about you will be made publicly available. We will only produce information about the general population. Again, should you wish not to answer a question or wish to stop the interview at any point, please let me know. If at any time you have any complaints or concerns about this survey, please contact the hotline number provided in this leaflet I gave you earlier. May I start the interview?

HP5. Did you receive one or two doses of the HPV vaccine? *If more than 2 doses, record '2'.*	ONE DOSE ....1 TWO DOSES ....2 DK 8	
HP6. Where did you receive your most recent HPV vaccination? *If unable to determine whether public, private or NGO, write the name of the place and then temporarily record '76' until you learn the appropriate category for the response.* _____ (*Name of place*)	**HEALTH FACILITY** PUBLIC HEALTH FACILITY ....11 PRIVATE HEALTH FACILITY ....12 NGO HEALTH FACILITY....13 DK IF PUBLIC, PRIVATE, OR NGO....76 SCHOOL ....21 OTHER (*specify*) _____96 DK 98	

ATTITUDES TOWARD DOMESTIC VIOLENCE				DV
DV1. Sometimes a husband is annoyed or angered by things that his wife does. In your opinion, is a husband justified in hitting or beating his wife in the following situations:	YES	NO	DK	
[A] If she goes out without telling him?	GOES OUT WITHOUT TELLING 1	2	8	
[B] If she neglects the children?	NEGLECTS CHILDREN....1	2	8	
[C] If she argues with him?	ARGUES WITH HIM 1	2	8	
[D] If she refuses to have sex with him?	REFUSES SEX....1	2	8	
[E] If she burns the food?	BURNS FOOD 1	2	8	

SDG16: SAFETY		VT
VT20. Now I would like to ask you about how safe you feel in certain situations. How safe do you feel walking alone in your neighbourhood after dark?	VERY SAFE ..... 1 SAFE ..... 2 UNSAFE ..... 3 VERY UNSAFE ..... 4 NEVER WALK ALONE AFTER DARK 7	
VT21. How safe do you feel when you are at home alone after dark?	VERY SAFE ..... 1 SAFE ..... 2 UNSAFE ..... 3 VERY UNSAFE ..... 4 NEVER ALONE AFTER DARK 7	

SDG16: DISCRIMINATION — **VT**

VT23. I will now ask you about discrimination. Discrimination happens when you are treated less favourably compared to others or harassed because of the way you look, where you come from, what you believe, or for other reasons.

In Ukraine, do you feel that you <u>personally</u> experienced any form of discrimination or harassment during the last 3 years, that is, since (***year of interview minus 3***), based on any of the following grounds? *Questions refer to the last 3 years. If yes, an additional question referring to the last 1 year will be asked and the CAPI application will add a sentence to the beginning of the next item to remind the respondent of the return to the 3-year reference period.*		YES	NO	DK
[A] Your sex, such as you are a man or a woman?	SEX	1	2 ⇨ *VT23[B]*	8 ⇨ *VT23[B]*
[A1] How about since (***month of interview***) (***year of interview minus 1***)?	SEX	1	2	8

UF10A. Hello, my name is (***your name***). We are from the Ukrainian Center for Social Reforms. Together with the State Statistics Service of Ukraine, we are conducting a survey about the situation of children, families, and households. I would like to talk to you about (***child's name from UF3***)'s health and well-being. This interview usually takes about 20 minutes. Participation in this survey is voluntary. No payment or incentive will be given to you for answering these questions. However, this survey will help the government and the general public better understand the situation and needs of young children. Please know that all the information you share during the interview will remain strictly confidential and anonymous. No information about you or your child will be made publicly available. We will only produce information about the general population. Should you feel uncomfortable about any questions and not wish to answer, just let me know and we can skip the question. Also, if you wish to stop the interview at any point just let me know. If at any time you have any complaints or concerns about this survey, please contact the hotline number provided in this leaflet. May I start the interview?	**UF10B**. Now I would like to talk to you about (***child's name from UF3***)'s health and well-being in more detail. This interview usually takes about 20 minutes. Again, participation in this survey is voluntary. No payment of incentive will be given to you for answering these questions. However, this survey will help the government and the general public better understand the situation and needs of young children. Please know that all the information you share during the interview will remain strictly confidential and anonymous. No information about you or your child will be made publicly available. We will only produce information about the general population. Again, should you wish not to answer a question or wish to stop the interview at any point, please let me know. If at any time you have any complaints or concerns about this survey, please contact the hotline number provided in this leaflet I gave you earlier. May I start the interview?	
YES ..... 1 NO / NOT ASKED 2	1 ⇨*UNDER FIVE'S BACKGROUND Module* 2 ⇨*UF17*	

UNDER-FIVE'S BACKGROUND		UB
UB0A. *Check relationship of respondent to child in the LIST OF HOUSEHOLD MEMBERS in the HOUSEHOLD QUESTIONNAIRE.*	BIOLOGICAL MOTHER (HL20 = HL14).....1 BIOLOGICAL FATHER (HL20 = HL18).....2 OTHER.....6	1 ⇨*UB1* 2 ⇨*UB1*

[E] Playing with (***name***)?	YES ..... 1 NO ..... 2 DK 8	 2 ⇨*EC5[F]* 8 ⇨*EC5[F]*
[E1] Who in the household engaged in this activity with (***name***)? *Probe:* Anyone else?	MOTHER ..... A FATHER ..... B OTHER X	
[F] Naming, counting, or drawing things for or with (***name***)?	YES ..... 1 NO ..... 2 DK 8	 2 ⇨*EC6* 8 ⇨*EC6*
[F1] Who in the household engaged in this activity with (***name***)? *Probe:* Anyone else?	MOTHER ..... A FATHER ..... B OTHER X	
EC6. I would like to ask you about certain things (***name***) is currently able to do. Please keep in mind that children can develop and learn at a different pace. For example, some start talking earlier than others, or they might already say some words but not yet form sentences. So, it is fine if your child is not able to do all the things I am going to ask about. You can let me know if you have any doubts about what answer to give. Can (***name***) walk on an uneven surface, for example a bumpy or steep road, without falling?	YES ..... 1 NO ..... 2 DK 8	
EC7. Can (***name***) jump up with both feet leaving the ground?	YES ..... 1 NO ..... 2 DK 8	
EC8. Can (***name***) dress (***him/herself***), that is, put on T-shirt and pants without help?	YES ..... 1 NO ..... 2 DK 8	
EC9. Can (***name***) fasten and unfasten buttons without help?	YES ..... 1 NO ..... 2 DK 8	
EC10. Can (***name***) say 10 or more words like “mama” or “ball”?	YES ..... 1 NO ..... 2 DK 8	
EC11. Can (***name***) speak using sentences of 3 or more words that go together, for example “I want water” or “This house is big"?	YES ..... 1 NO ..... 2 DK 8	 2 ⇨*EC13* 8 ⇨*EC13*
EC12. Can (***name***) speak using sentences of 5 or more words that go together, for example “This house is very big and beautiful”?	YES ..... 1 NO ..... 2 DK 8	
EC13. Can (***name***) correctly use any of the words “I,” “you,” “she,” or “he,” for example “I want water,” or “He eats kasha”?	YES ..... 1 NO ..... 2 DK 8	

EC14. If you show (***name***) an object (***he/she***) knows well, such as a cup or animal, can (***he/she***) consistently name it? *Probe:* By consistently I mean that (***he/she***) uses the same word to refer to the same object, even if the word used is not fully correct.	YES ..... 1 NO ..... 2 DK 8	
EC15. Can (***name***) recognise at least 5 letters of the alphabet?	YES ..... 1 NO ..... 2 DK 8	
EC16. Can (***name***) write (***his/her***) own name?	YES ..... 1 NO ..... 2 DK 8	
EC17. Does (***name***) recognise all numbers from 1 to 5?	YES ..... 1 NO ..... 2 DK 8	
EC18. If you ask (***name***) to give you 3 objects, such as 3 stones or 3 nuts, does (***he/she***) give you the correct amount?	YES ..... 1 NO ..... 2 DK 8	
EC19. Can (***name***) count 10 objects, for example 10 fingers or 10 blocks, without mistakes?	YES ..... 1 NO ..... 2 DK 8	
EC20. Can (***name***) do an activity, such as coloring or playing with blocks without repeatedly asking for help or giving up too quickly?	YES ..... 1 NO ..... 2 DK 8	
EC21. Does (***name***) ask about familiar people other than parents when they are not there, for example "Where is Grandma?"?	YES ..... 1 NO ..... 2 DK 8	
EC22. Does (***name***) offer to help someone who seems to need help?	YES ..... 1 NO ..... 2 DK 8	
EC23. Does (***name***) get along well with other children?	YES ..... 1 NO ..... 2 DK 8	
EC24. The next two questions have five different options for answers. I am going to read these to you after each question. How often does (***name***) seem to be very sad or depressed? Would you say: daily, weekly, monthly, a few times a year, or never?	DAILY ..... 1 WEEKLY ..... 2 MONTHLY ..... 3 A FEW TIMES A YEAR ..... 4 NEVER ..... 5 DK 8	
EC25. Compared with children of the same age, how much does (***name***) kick, bite, or hit other children or adults? Would you say: not at all, less, the same, more, or a lot more?	NOT AT ALL ..... 1 LESS ..... 2 THE SAME ..... 3 MORE ..... 4 A LOT MORE ..... 5 DK 8	

CHILD DISCIPLINE		UCD
UCD1. *Check UB2: Child's age?*	AGE 0 ..... 1 AGE 1, 2, 3 OR 4 2	1 ⇨*End*
UCD2. Adults use certain ways to teach children the right behaviour or to address a behaviour problem. I will read various methods that are used. Please tell me if you or any other adult in your household has used this method with ***(name)*** in the past month.	YES NO	
[A] Took away privileges, forbade something ***(name)*** liked or did not allow (***him/her***) to leave the house.	TOOK AWAY PRIVILEGES 1 2	
[B] Explained why ***(name)***'s behaviour was wrong.	EXPLAINED WRONG BEHAVIOUR..... 1 2	
[C] Shook (***him/her***).	SHOOK HIM/HER 1 2	
[D] Shouted, yelled at, or screamed at (***him/her***).	SHOUTED, YELLED, SCREAMED 1 2	
[E] Gave (***him/her***) something else to do.	GAVE SOMETHING ELSE TO DO 1 2	
[F] Spanked, hit, or slapped (***him/her***) on the bottom with bare hand.	SPANKED, HIT, SLAPPED ON BOTTOM WITH BARE HAND 1 2	
[G] Hit (***him/her***) on the bottom or elsewhere on the body with something like a belt, hairbrush, stick or other hard object.	HIT WITH BELT, HAIRBRUSH, STICK OR OTHER HARD OBJECT 1 2	
[H] Called (***him/her***) dumb, lazy or another name like that.	CALLED DUMB, LAZY OR ANOTHER NAME 1 2	
[I] Hit or slapped (***him/her***) on the face, head, or ears.	HIT / SLAPPED ON FACE, HEAD OR EARS 1 2	
[J] Hit or slapped (***him/her***) on the hand, arm, or leg.	HIT / SLAPPED ON HAND, ARM OR LEG 1 2	
[K] Beat (***him/her***) up, that is hit (***him/her***) over and over as hard as one could.	BEAT UP, HIT OVER AND OVER AS HARD AS ONE COULD 1 2	
UCD3. *Check UF4: Is this respondent the mother or caregiver of any other children under age 5 or a child age 5-14 selected for the QUESTIONNAIRE FOR CHILDREN AND ADOLESCENTS AGE 5-17?*	YES ..... 1 NO 2	2 ⇨*UCD5*
UCD4. *Check UF4: Has this respondent already responded to the following question (UCD5 or FCD5) for another child?*	YES ..... 1 NO 2	1 ⇨*End*
UCD5. Do you believe that in order to bring up, raise, or educate a child properly, the child needs to be physically punished?	YES ..... 1 NO ..... 2 DK / NO OPINION 8	

CHILD FUNCTIONING		UCF
UCF1. *Check UB2: Child's age?*	AGE 0 OR 1 ..... 1 AGE 2, 3 OR 4 2	1 ⇨*End*
UCF2. I would like to ask you some questions about difficulties (***name***) may have. Does (***name***) wear glasses?	YES ..... 1 NO 2	
UCF3. Does (***name***) use a hearing aid?	YES ..... 1 NO 2	
UCF4. Does (***name***) use any equipment or receive assistance for walking?	YES ..... 1 NO 2	
UCF5. In the following questions, I will ask you to answer by selecting one of four possible answers. For each question, would you say that (***name***) has: 1) no difficulty, 2) some difficulty, 3) a lot of difficulty, or 4) that (***he/she***) cannot at all. *Repeat the categories during the individual questions whenever the respondent does not use an answer category:* Remember the four possible answers: Would you say that (***name***) has: 1) no difficulty, 2) some difficulty, 3) a lot of difficulty, or 4) that (***he/she***) cannot at all?

FS10A. Hello, my name is (***your name***). We are from the Ukrainian Center for Social Reforms. Together with the State Statistics Service of Ukraine we are conducting a survey about the situation of children, families, and households. I would like to talk to you about (***child's name from FS3***)'s health and well-being. This interview usually takes about 15 minutes. Participation in this survey is voluntary. No payment or incentive will be given to you or your family members for answering these questions. However, the information gathered will be very helpful for the government and the general public to better understand the situation and needs of children and adolescents. Please know that all the information you share during the interview will remain strictly confidential and anonymous. No information about you or your child will be made publicly available. We will only be producing information about the general population. Should you feel uncomfortable about any questions and not wish to answer, just let me know and we can skip the question. Also, if you wish to stop the interview at any point just let me know. If at any time you have any complaints or concerns about this survey, please contact the hotline number provided in this leaflet. May I start the interview?	**FS10B**. Now I would like to talk to you about (***child's name from FS3***)'s health and well-being in more detail. This interview usually takes about 15 minutes. Again, participation in this survey is voluntary. No payment of incentive will be given to you for answering these questions. However, this survey will help the government and the general public better understand the situation and needs of children and adolescents. Please know that all the information you share during the interview will remain strictly confidential and anonymous. No information about you or your child will be made publicly available. We will only produce information about the general population. Again, should you wish not to answer a question or wish to stop the interview at any point, please let me know. If at any time you have any complaints or concerns about this survey, please contact the hotline number provided in this leaflet I gave you earlier. May I start the interview?
